Identifiers-National Science Foundation, Office of Science Information Service

Reported are the findings of a study of scientific societies in the United States. Some 449 professional organizations were considered of which 284 conformed to the validation criteria for inclusion. Data gathering was most successful on membership, current dues, society history, and purpose and less successful on topics related to society income and expenses, specific functions and activities, and future plans. Extensive tables of data in these areas are included, and recommendations are presented for improving the collection, maintenance, and use of base line data concerning the nation's scientific societies. ## SUMMARY

A total of 449 professional organizations were considered in this study of scientific societies, from which a total of 284 were selected as conforming to the validation criteria set forth for inclusion. Owing to the limitations of the data gathering techniques employed, information was not obtained on all topics set forth in the original study objectives. The data gathering was most successful with respect to the topics relating to membership, current dues, society history, and purpose. Data gathering was least successful with regard to topics related to society income and expenses, specific functions and activities, and future plans. This report sets forth and discusses the findings of the study. Those areas in which data gathering proved inadequate are also described and recommendations are presented for improving the collection, maintenance, and use of base line data concerning the nation's scientific societies.

## INTRODUCTION

This report contains the results of a study of the professional scientific societies in the United States as they exist in 1968. The study was performed by the staff of the Special Studies Department of the Wolf Research and Development Corporation; it was sponsored by the Office of Science Information Service of the National Science Foundation, which carried out similar studies of scientific societies in 1959\* and 1963-64\*\*. All three studies are similar in purpose to the extent that they attempt to identify and describe significant current characteristics of scientific societies in the United States.

This study differs from the two previous studies in two important respects. First, the contractor was required to collect all data from existing documented sources, instead of by mail questionnaire survey, the method employed in the previous studies. (A second phase of the current study has been considered by NSF which would employ a mail questionnaire survey to supplement the data gathering of this first phase effort should the need arise; however, Phase II has not yet been initiated.) The second important difference about the current study is that the data

---

\* Dues and Membership in Scientific Societies, NSF-60-55, National Science Foundation, Washington, D.C., 1960.

\*\* Professional Scientific Societies: Their Memberships, Dues, and Activities, A report prepared for the National Science Foundation, by Bureau of Social Science Research, Inc., Washington, D.C., 1964.

gathering effort was designed not only to provide aggregate statistics concerning the universe of scientific societies, but also to provide specific profiles of each individual society and its key characteristics and activities.

The present study was begun in July 1968, with first effort being directed towards the definition of data to be collected and the assessment of possible data sources available to the study staff. As a result of discussions with the NSF staff, detailed descriptions were derived of the overall topics and questions to be investigated, relating to the universe of scientific societies and the specific information describing the characteristics and activities of individual societies to be accumulated into the individual society files. After exploring various sources such as libraries, reference works, and special collections of data, it was concluded that the best sources of available data for the study would be the cumulative editions of the various directories of scientific societies\*, augmented and supplemented by the various brochures, prospectuses, and reports produced and readily made available by the scientific societies themselves. A complete list of data elements to be collected was subsequently derived and formatted into a data recording worksheet\*\*. Working copies of reference works to be used were obtained, and letters requesting copies of available publications were mailed to all scientific societies nominated for inclusion in the study. Of a total of 439 societies from which information was requested, useful responses were obtained from 358.

---

\* A list of the references used is included as Appendix I.

\*\* A replica of the data worksheet is included as Appendix IV.

Throughout the course of the study, 449 societies were nominated for possible inclusion from many sources. However, after a process of examining the information on each nominated society and comparing it to the criteria established for the study, only 284 societies were validated and finally included. The criteria for determining which organizations would be considered scientific societies for purposes of this study were established by NSF, and are presented in Appendix II.

For all validated societies, data were extracted from available reference works, brochures, and other acquired documents and recorded on a data worksheet from which statistical compilations were then derived. These worksheets will also serve as the society profile documents which will be delivered to NSF for further internal use and reference.

The study staff wishes to express its appreciation for the guidance and assistance provided by the staff of the National Science Foundation, particularly Mr. Henry Tovey, Miss Inez O'Brien, Mr. Albert C. Lefebvre, and Mrs. Frances M. Pentecost. Also, the cooperation and assistance of Mr. James L. Olsen, Jr. of the National Academy of Sciences - National Academy of Engineering Library and Mrs. Margaret Fisk of the Gale Research Company were of great value to the study.

In addition to the authors, members of the professional staff of the Special Studies Department who participated in this study included Messrs. Wallace R. Kocher, Robert F. Nasal, Thomas M. Janulewicz, and Robert G. Childs.

The statistical and analytical results of this study are contained in the report that follows. It should be noted that complete information was not obtainable from the existing literature on all of the topics set forth as objectives for this study and that some of the relationships described are based on limited data.

## SECTION I

### SOCIETIES: 1968

#### A. THE UNIVERSE OF U.S. SCIENTIFIC SOCIETIES

During the course of the present study, 284 organizations were determined to conform to the criteria set forth by the National Science Foundation for inclusion in this analysis of scientific societies. Since the study represented an extensive but not exhaustive attempt to identify every possible scientific society, the total number of societies established by the study should be considered a minimum, but close approximation of the actual total number of such societies. Throughout the entire study effort, additional candidate societies continued to appear. These were investigated and included where applicable. Constraints of time and funds limited the continued active search for candidate societies.

The total number of scientific societies included in this study is greater than the total number included in either of the two previous studies as shown below:

- 1959 study - 177 societies
- 1964 study - 188 societies
- 1968 study - 284 societies

Owing to major differences in the criteria for inclusion employed in the three studies, and to the methodological variances in data gathering techniques, no direct inferences can be drawn from the sharp increase of the number of societies included in the present study over the two previous studies. However, the major contributing factors are:

- Inclusion in the two earlier studies was dependent upon the return of a completed mail questionnaire, whereas inclusion in the present study was determined solely by the study staff based upon published descriptions of the society.
- The present study represents a more extensive attempt to identify societies for inclusion than the previous studies, and benefitted from the results of the two previous studies.
- Greater emphasis in the current study was placed on the inclusion of agricultural and engineering societies.
- Certain key umbrella societies which do not have individual members, such as the American Geological Institute and the Engineers Joint Council, were included in the present study at the request of NSF.

Table 1 provides some basis for comparing the general composition of the total societies included in the present study with those included in the previous studies.

TABLE 1  
COMPARISON OF NUMBER OF SOCIETIES  
STUDIED IN 1968, 1964, 1959

DISCIPLINE	NUMBER OF SOCIETIES		
	1968	1964	1959
<u>PHYSICAL SCIENCE</u> (PHYSICS, CHEMISTRY, GEOSCIENCES, AQUATIC SCIENCES, ATMOSPHERIC AND SPACE SCIENCES, MATERIALS SCIENCES)	77	40	34
<u>BIOLOGICAL SCIENCE</u> (BIOLOGICAL SCIENCES, AGRICULTURAL SCIENCES)	86	59	67
<u>ENGINEERING</u>	56	23	35
<u>MATHEMATICS</u> (MATHEMATICS AND STATISTICS)	17	10	8
<u>SOCIAL SCIENCE</u> (PSYCHOLOGICAL SCIENCES, ECONOMICS, SOCIOLOGY, ANTHROPOLOGY, LINGUISTICS, ARCHAEOLOGY, POLITICAL SCIENCE)	36	45	22
<u>OTHER MISCELLANEOUS</u> (PHILOSOPHY AND HISTORY OF SCIENCE, GENERAL SCIENCE)	12	11	11
TOTAL	284	188	177

Of the societies included in the present study, 5 have been established since the last study in 1964, and a total of 20 since 1958. These are listed below:

#### Engineering

- Fluid Power Society - 1960
- Society of Logistics Engineers - 1966

#### Physics

- Society for Applied Spectroscopy - 1958
- Fine Particles Society - 1968

#### Geosciences

- American Institute of Professional Geologists - 1963
- Clay Minerals Society - 1963
- Geoscience Information Society - 1965

#### Aquatic Sciences

- American Water Resources Association - 1964
- Marine Technology Society - 1963

### Materials Science

- Society of Wood Science and Technology - 1958

### Mathematics and Statistics

- Association of Educational Data Systems - 1962
- American Society for Cybernetics - 1966

### Biological Sciences

- American Society for Cell Biology - 1960
- Association for Tropical Biology - 1963
- International Organization of Plant Biosystematists - 1962
- Society of Nematologists - 1961

### Psychological Sciences

- International Society for the Study of Symbols - 1963
- Psychonomic Society - 1959

### Philosophy and History of Science

- Society for the History of Discoveries - 1960
- Society for the History of Technology - 1958

Two mergers have occurred since the last study and a total of 6 since 1958. These are listed below.

## Engineering

- The American Society of Heating and Air Conditioning Engineers merged in January of 1959, with the American Society of Refrigerating Engineers to form the American Society of Heating, Refrigerating and Air Conditioning Engineers, Inc.
- In 1963, the American Institute of Electrical Engineers merged with the Institute of Radio Engineers to form the Institute of Electrical and Electronic Engineers, Inc.
- In 1959, the Institute of Environmental Sciences was formed by the merger of the Institute of Environmental Engineers and the Society of Environmental Engineers.
- In 1961, the Society of Automobile Engineers merged with the American Society of Aeronautical Engineers and Society of Tractor Engineers to form the Society of Automotive Engineers, Inc.

## Atmospheric and Space Sciences

- In 1963, the American Rocket Society merged with the Institute of Aerospace Sciences to form the American Institute of Aeronautics and Astronautics.

## Biological Sciences

- In 1962, the Genetic Society of America was formed by the merger of the Genetic Section of the American Society of Zoologists and the Genetic Section of the Botanical Society of America.

### B. A SCHEME FOR CATEGORIZING SCIENTIFIC SOCIETIES

To a great extent, the value and meaning that can be derived from a study of scientific societies depends upon the basis by which the societies are grouped together for analysis.

In the study of scientific societies conducted in 1959, all scientific societies were categorized according to the following eight scientific discipline headings:

- Engineering
- Chemistry
- Biology
- Social Science
- Physics
- Earth Science
- Miscellaneous
- Mathematics

The study conducted in 1964, categorized societies under the following five discipline headings:

- Physical Sciences
- Social Sciences

- Biological Sciences
- Engineering
- Mathematics

In planning for the present study, it was decided that a finer degree of category subdivision which recognized and reflected present and future science information activities would be most useful. Hence, the following nineteen element category scheme was developed:

●	Engineering	56
●	Chemistry	13
●	Physics	19
●	Geosciences	21
●	Aquatic Sciences	4
●	Atmospheric and Space Sciences	7
●	Materials Sciences	13
●	Mathematics and Statistics	17
●	Agricultural Sciences	18
●	Biological Sciences	68
●	Psychological Sciences	14
●	Economics	5
●	Sociology and Social Work	5
●	Anthropology	5
●	Linguistics	3
●	Archaeology	2
●	Political Science	2
●	Philosophy and History of Science	4
●	General Science	8
	TOTAL	<hr/> 284
		Societies

The primary basis for the above category scheme is the present and probable future organization of the major disciplinary science information programs in the United States. The scheme directly reflects the existence of on-going science information programs in disciplinary fields such as physics, chemistry, and mathematics. In fields where such major programs have not yet been initiated, the scheme attempts to provide a plausible basis for anticipating future science information program activities and for assessing the characteristics and activities of societies within these fields.

The engineering and biological sciences categories are by far the largest. However, no practical way to subdivide these fields into several smaller fractions could be established which would reflect both natural disciplinary subdivisions and science information activities.

## C. SCIENTIFIC SOCIETIES AND THEIR DISCIPLINE FAMILIES

In order to relate societies to scientific disciplines and fields, each society was categorized with respect to its primary discipline or field. Secondary relationships with other disciplinary fields were also established for each society. The discipline groups (or "families"), thus created, provided the primary basis for analyzing and depicting scientific societies.

In the descriptions that follow, each of the nineteen discipline categories is profiled with respect to the scientific society activities related thereto. The reader is cautioned to bear in mind that these disciplinary sketches were developed from incomplete data obtained from secondary sources, and that the conclusions and observations presented reflect subjective judgements derived from these data.

### 1. Engineering

There are 56 scientific societies in the United States primarily concerned with engineering; there are 52 other societies indirectly or secondarily associated with engineering. All of these societies are shown in Figure 1, which indicates the specific inter-society relationships identified during the course of the study. Figure 1, also indicates indirectly the relationships between discipline families.

Organizationally, The Engineers Joint Council is the central organization among engineering societies since it is an umbrella organization whose membership is composed of other affiliated engineering societies.

## SOCIETIES RELATED TO ENGINEERING

FIGURE 1

The Engineers Joint Council fulfills a central role in the information activities among engineering societies in cooperation with and with representation by other groups in the profession, specifically the United Engineering Trustees, Engineering Index, and the Engineering Societies Library.

The largest society in the field is the Institute of Electrical and Electronics Engineers with 160,000 members. The second largest society is the National Society of Professional Engineers with 66,000 members.

The oldest society in the engineering field is the American Society of Civil Engineers which was founded in 1852. Two new engineering societies have been established in the past decade; the Fluid Power Society in 1960, and the Society of Logistics Engineers in 1966.

Over the past decade, the Institute of Environmental Sciences has experienced the most rapid rate of growth, increasing membership by 257%. In terms of actual numbers of new members, the American Society of Mechanical Engineers ranks first with the addition of 10,631 members.

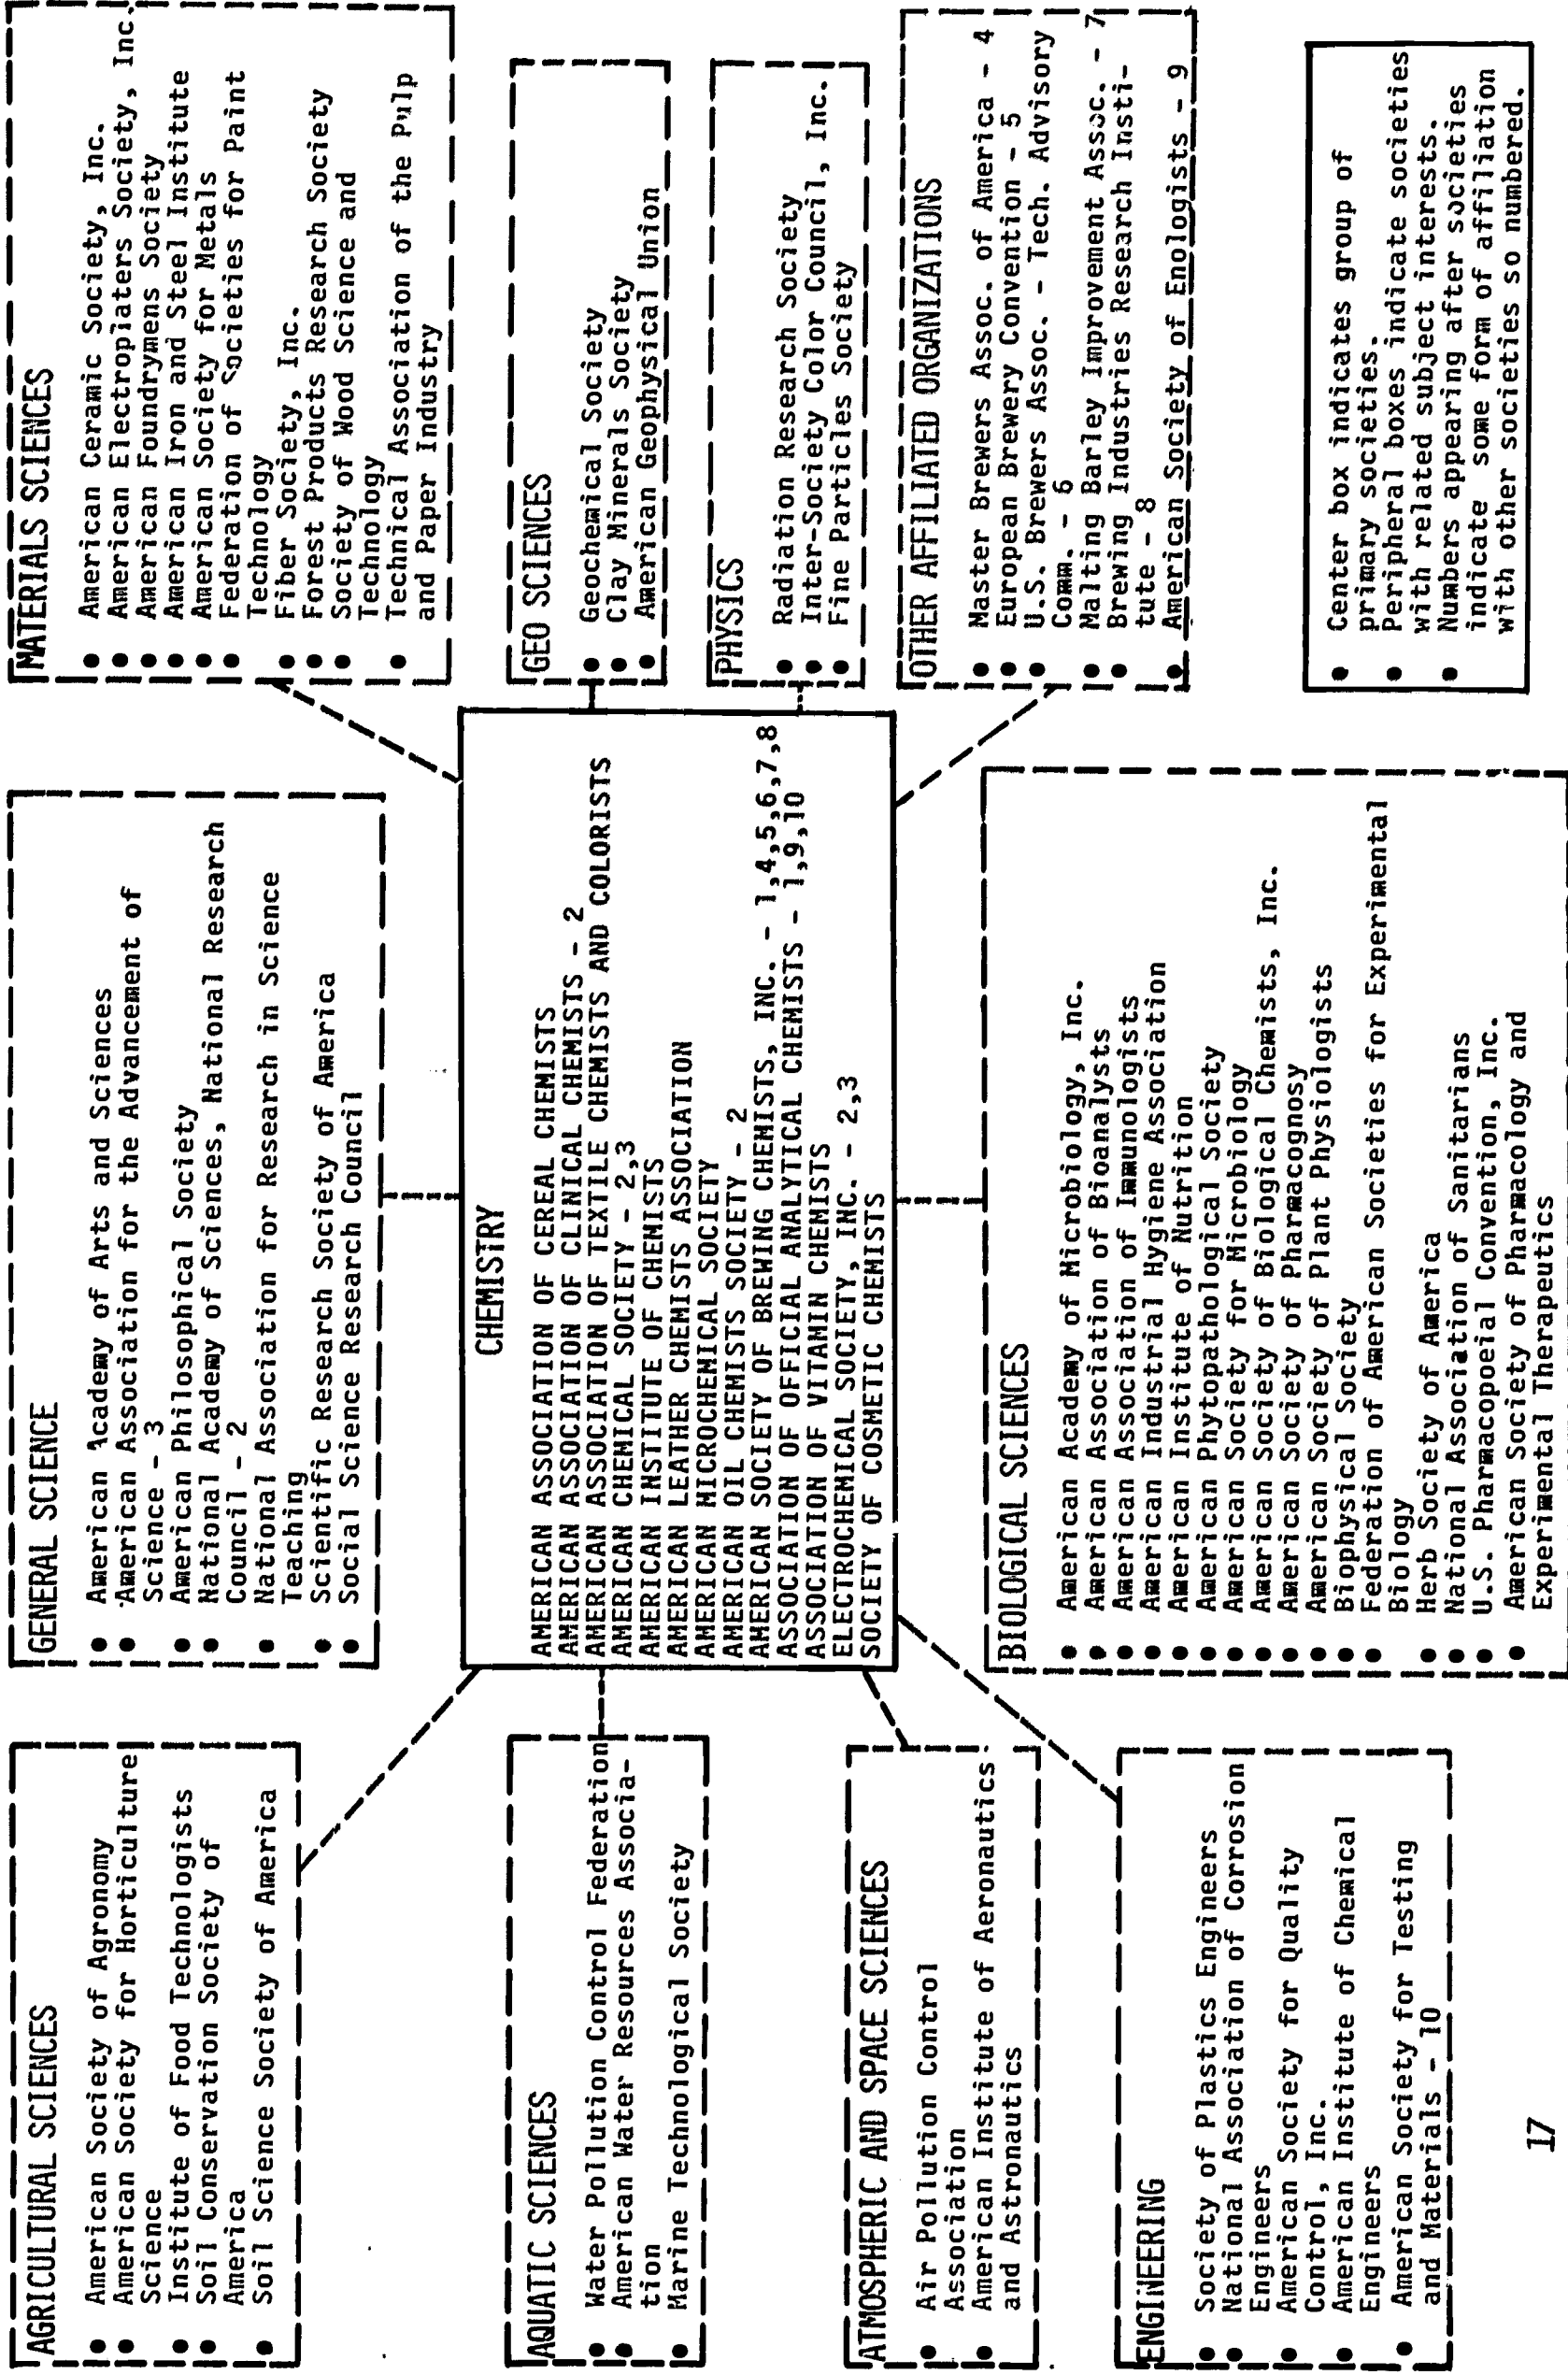

## 2. Chemistry

There are thirteen scientific societies in the United States primarily associated with chemistry, and fifty-three other societies are secondarily or indirectly related. Figure 2 graphically depicts all of the societies related to chemistry.

FIGURE 2

SOCIETIES RELATED TO CHEMISTRY

In terms of its information programs, its discipline centrality, its membership, and its growth, the American Chemical Society is clearly the dominant and most central society in the discipline of chemistry.

The largest society in chemistry is the American Chemical Society with 115,500 members. The next largest, the American Association of Textile Chemists and Colorists, has only 8300 members.

The American Chemical Society is also the oldest society in the field, founded in 1876. There have been no new societies established in the field of chemistry in the past decade.

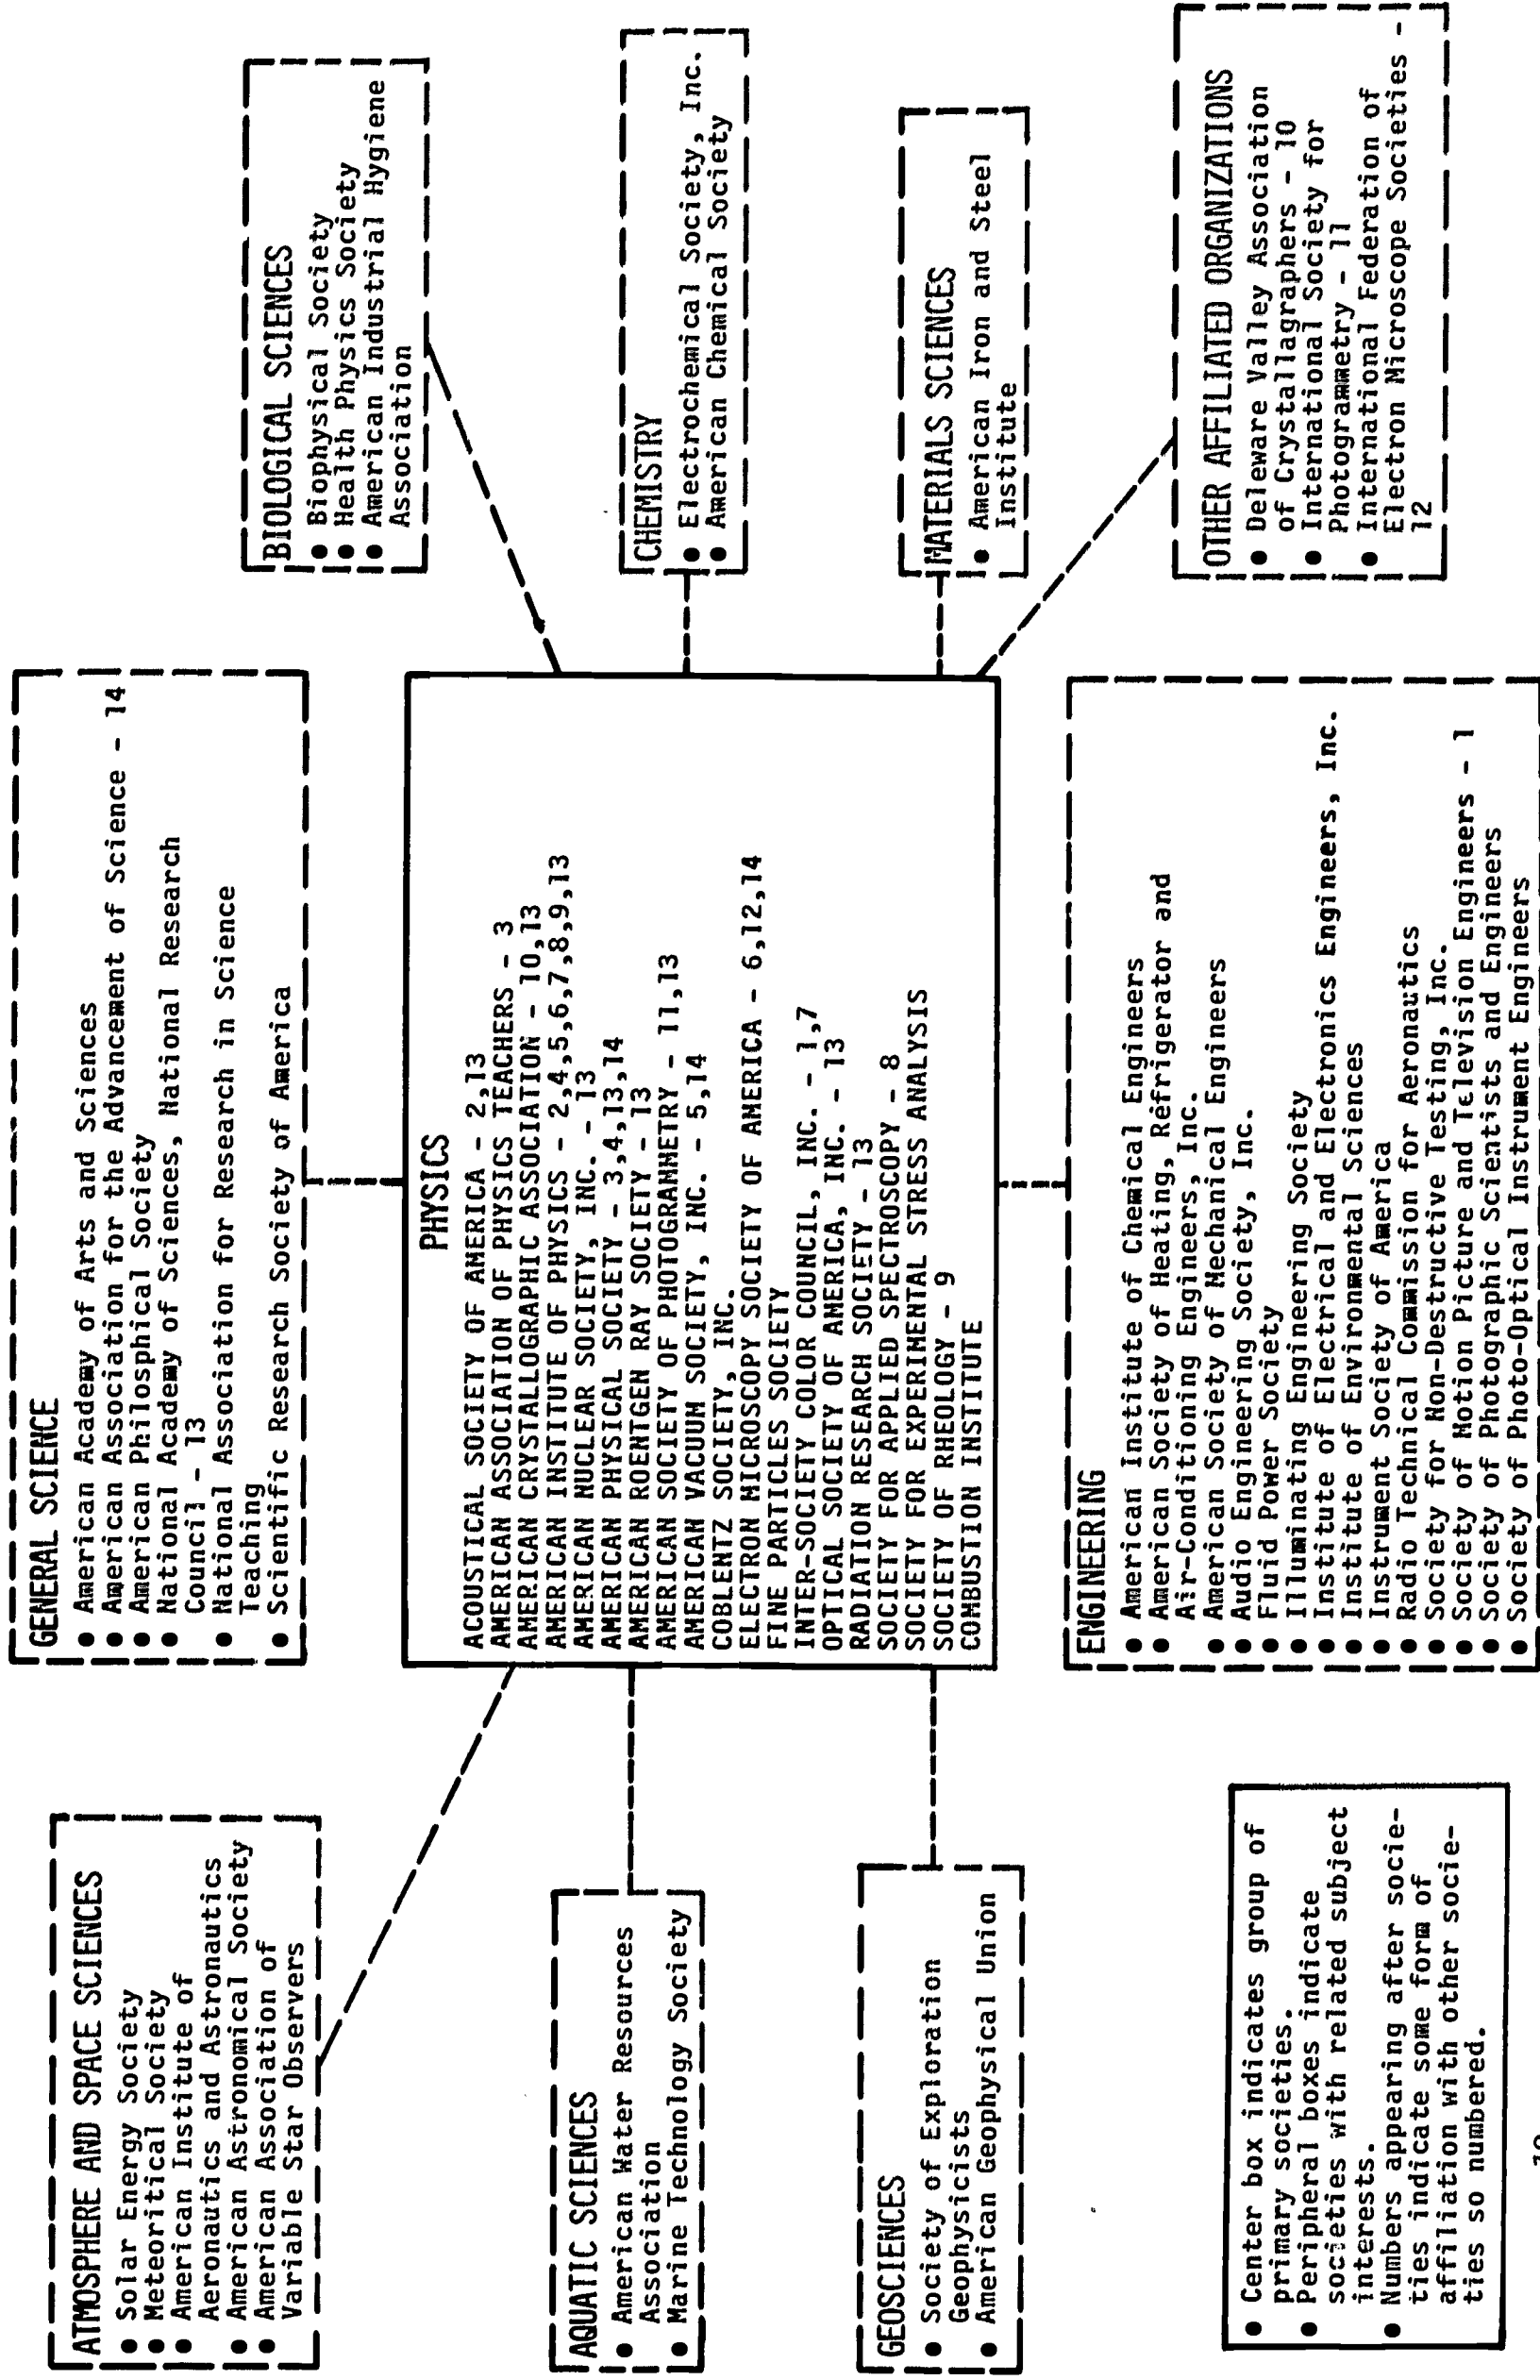

Over the past three years, the American Association of Cereal Chemists has had the most rapid growth with a 60% rise in membership. Over the past decade, the American Association of Clinical Chemists has had the greatest percentage increase in membership, rising by 93%. However, in actual numbers of new members, the American Chemical Society has experienced the greatest increase in membership with 26,800 new members in the past three years.

### 3. Physics

There are 19 scientific societies in the United States primarily concerned with physics and 35 other societies are indirectly or secondarily related. The societies associated with physics are graphically depicted in Figure 3.

FIGURE 3

SOCIETIES RELATED TO PHYSICS

• Center box indicates group of primary societies.  
 • Peripheral boxes indicate societies with related subject interests.  
 • Numbers appearing after societies indicate some form of affiliation with other societies so numbered.

In physics, the American Institute of Physics (AIP) is the central society. It was founded in 1931 by five of its current member societies. The AIP is now an umbrella society with seven member societies and eighteen affiliated societies. Under AIP's constitution, individual members of the Member Societies are automatically members of the Institute, which accounts for its 35,500 members.

In terms of individual memberships, the single largest society in physics is the American Physical Society with 22,953; followed by the American Association of Physics Teachers with 11,000 members.

The oldest society in the field is the American Physical Society which was founded in 1899. New societies established within the past decade are the Society for Applied Spectroscopy founded in 1958 and the Fine Particles Society founded in 1968.

Over the past three years, the Coblenz Society, Inc., has had the most rapid rate of increase in membership, rising by 81%. Over the past decade, the American Vacuum Society has had the largest percentage increase in membership, rising by 1050%. In terms of actual numbers, the American Association of Physics Teachers ranks first with the addition of 3,526 new members over the past three years.

The major role in science information activities in physics is that of the American Institute of Physics. Its primary publications represent 35 percent of the world's physics literature. It conducts research towards the development of an information system for physics, and is developing tools for the analysis and retrieval of information.

#### 4. Geosciences

There are 21 scientific societies in the United States primarily concerned with the geosciences; 25 other societies are indirectly or secondarily related. The societies associated with the geosciences are graphically depicted in Figure 4.

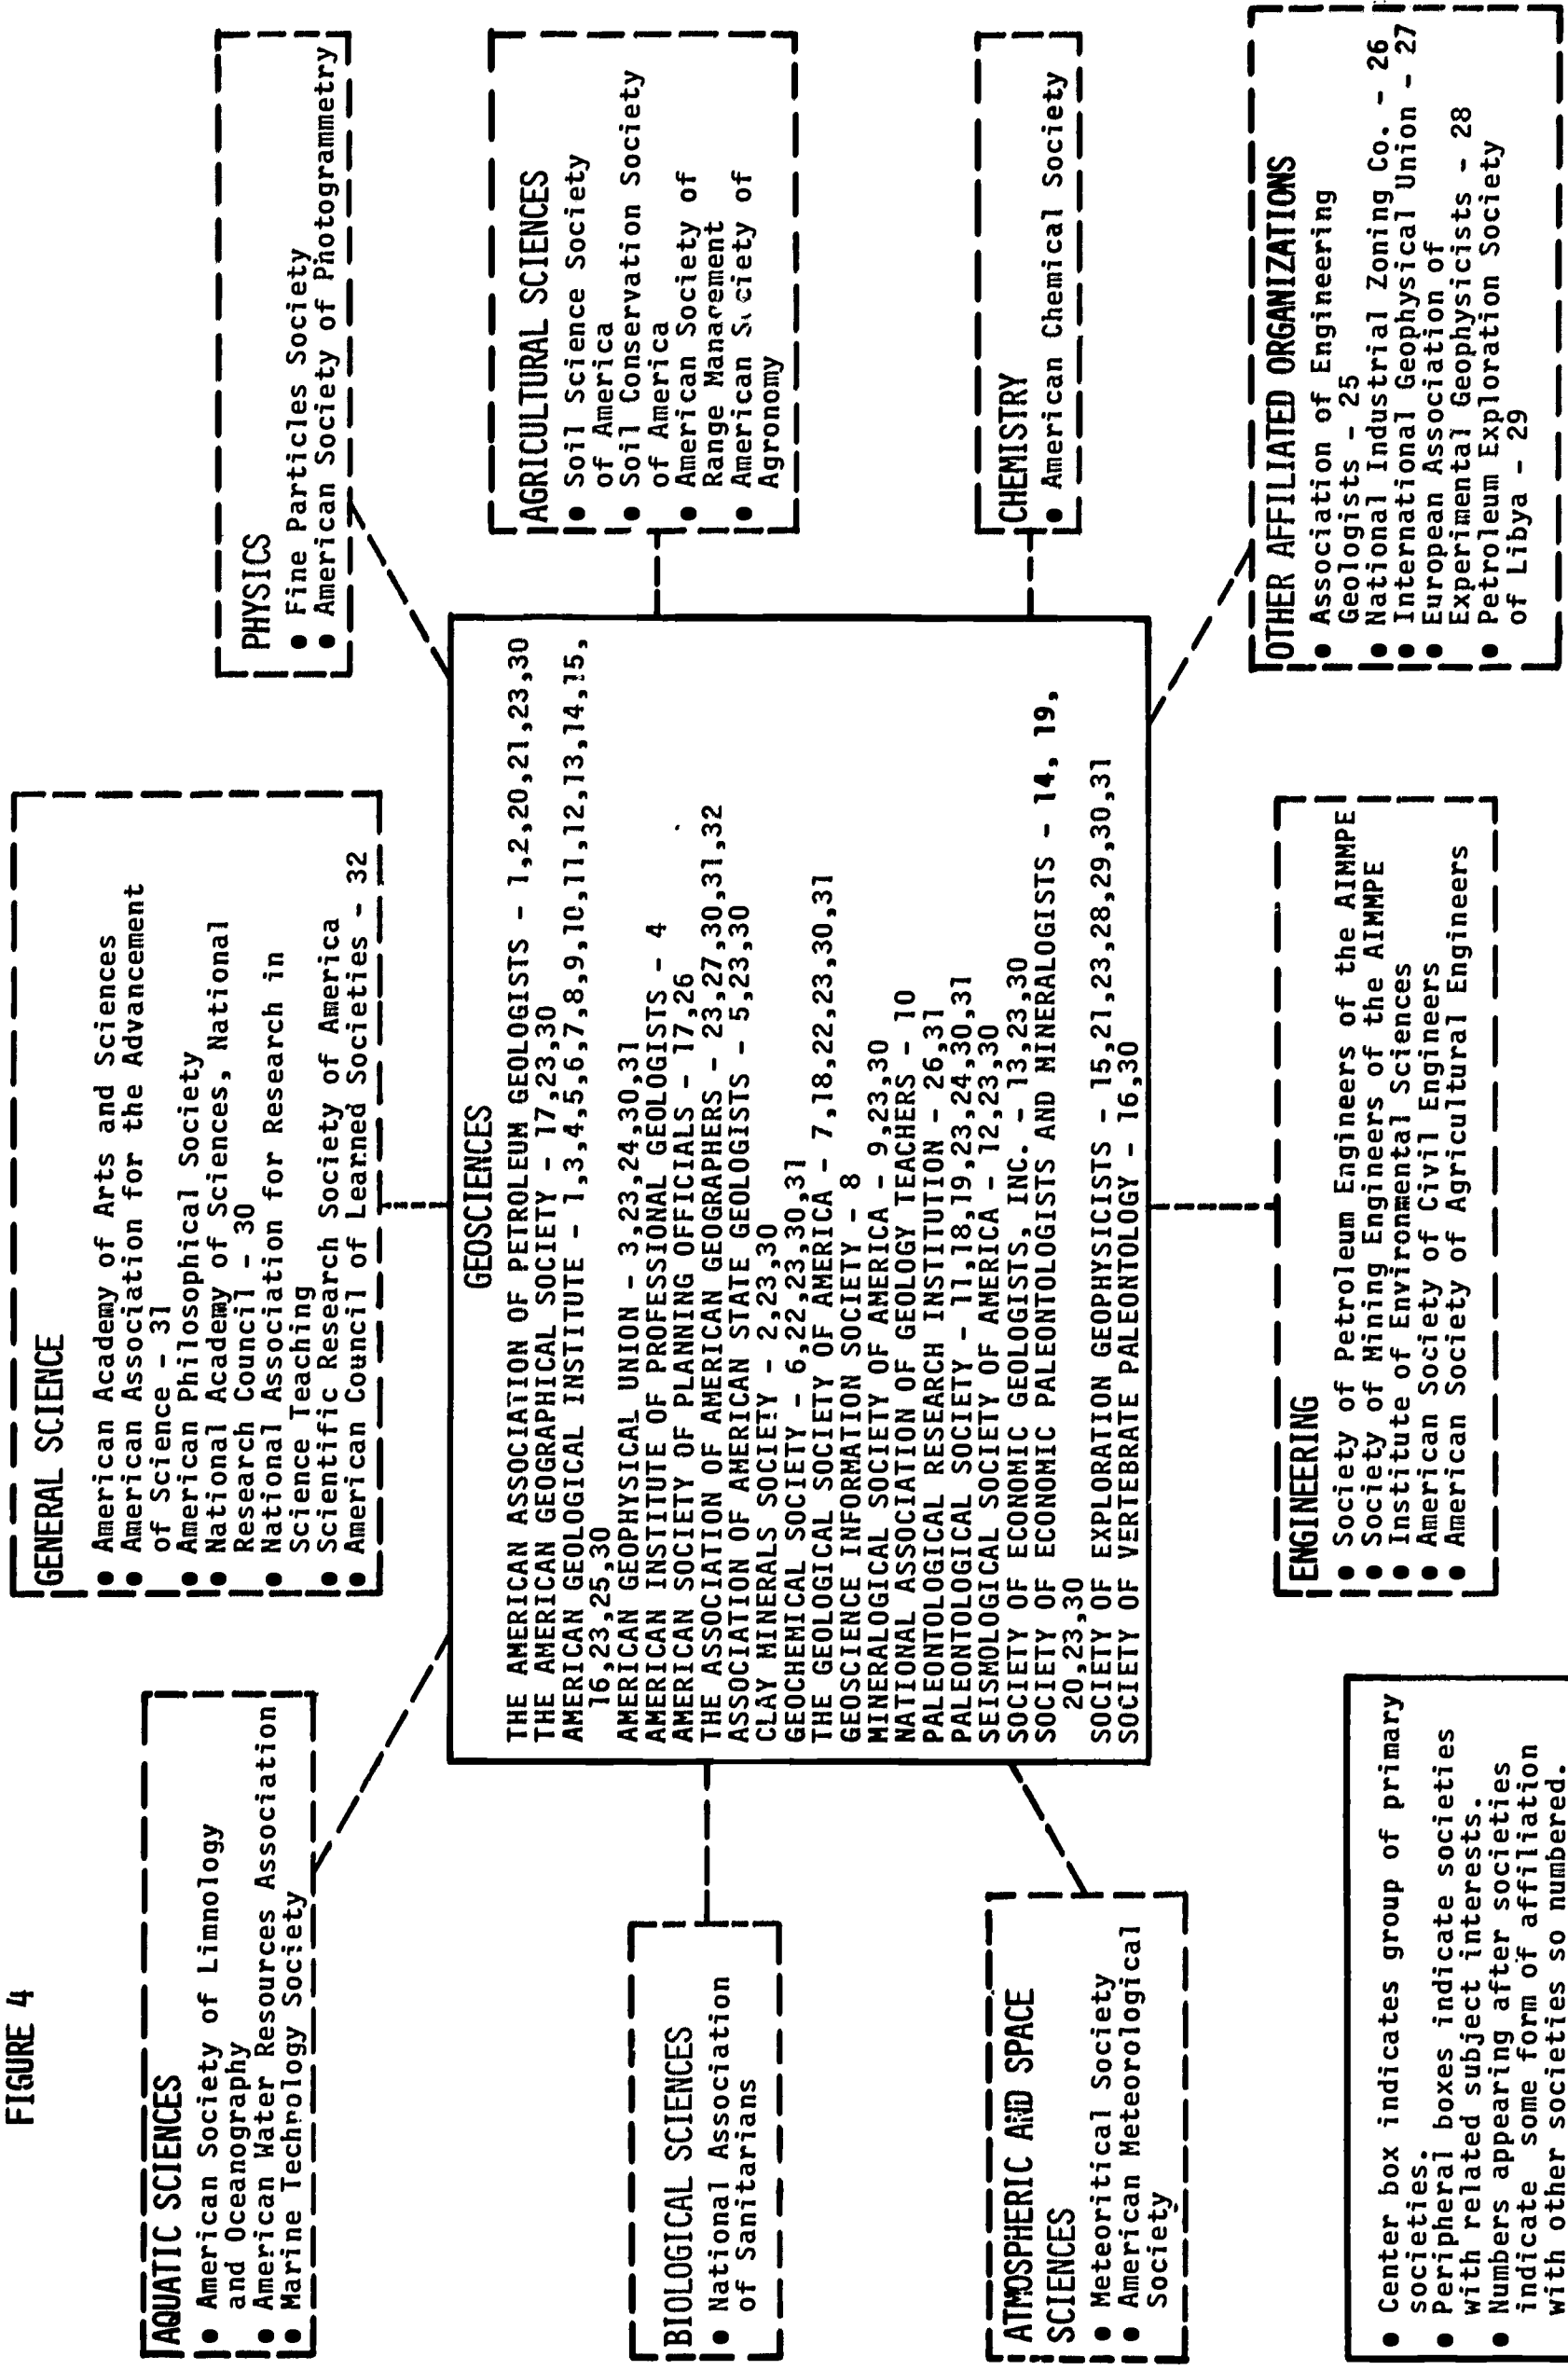

In the geosciences, the American Geological Institute (AGI) is the central society, which is in fact its primary purpose for being. The AGI is an umbrella society, whose members are 16 other geological societies which look to the AGI to coordinate and supplement the work of member societies both within the geological sciences, and between the geological sciences and the rest of the scientific community. All 16 member societies of the AGI are included in the primary field of geosciences shown in Figure 4, and represent a combined membership of approximately 30,000 geological scientists.

In terms of individual memberships, the single largest society in the geosciences is the American Association of Petroleum Geologists with 15,000 members, followed by the American Geophysical Union with 9,600, and the Geological Society of America with 7,200 members.

The oldest society in the field is the American Geographical Society which was founded in 1852. New societies established within the past decade are the American Institute of Professional Geologists founded in 1963, the Clay Minerals Society founded in 1963, and the Geoscience Information Society founded in 1965.

FIGURE 4

# SOCIETIES RELATED TO THE GEOSCIENCES

Center box indicates group of primary societies.  
Peripheral boxes indicate societies with related subject interests.  
Numbers appearing after societies indicate some form of affiliation with other societies so numbered.

Over the past three years, the Association of American Geographers has had the most rapid rate of increase in membership, rising by 119%. Over the past decade, the National Association of Geology Teachers has had the largest percentage increase in membership, rising by 324%. In terms of actual numbers, the Association of American Geographers ranks first in the field with the addition of 2446 new members over the past three years.

In terms of the breadth of subject coverage and comprehensiveness of service, several societies play major roles in the publication and dissemination of scientific information, particularly the American Geophysical Union, the Geological Society of America, and the Mineralogical Society of America. The Geoscience Information Society plays a special role in information affairs since its principal purpose is to initiate, aid, and improve the exchange of information in the earth sciences.

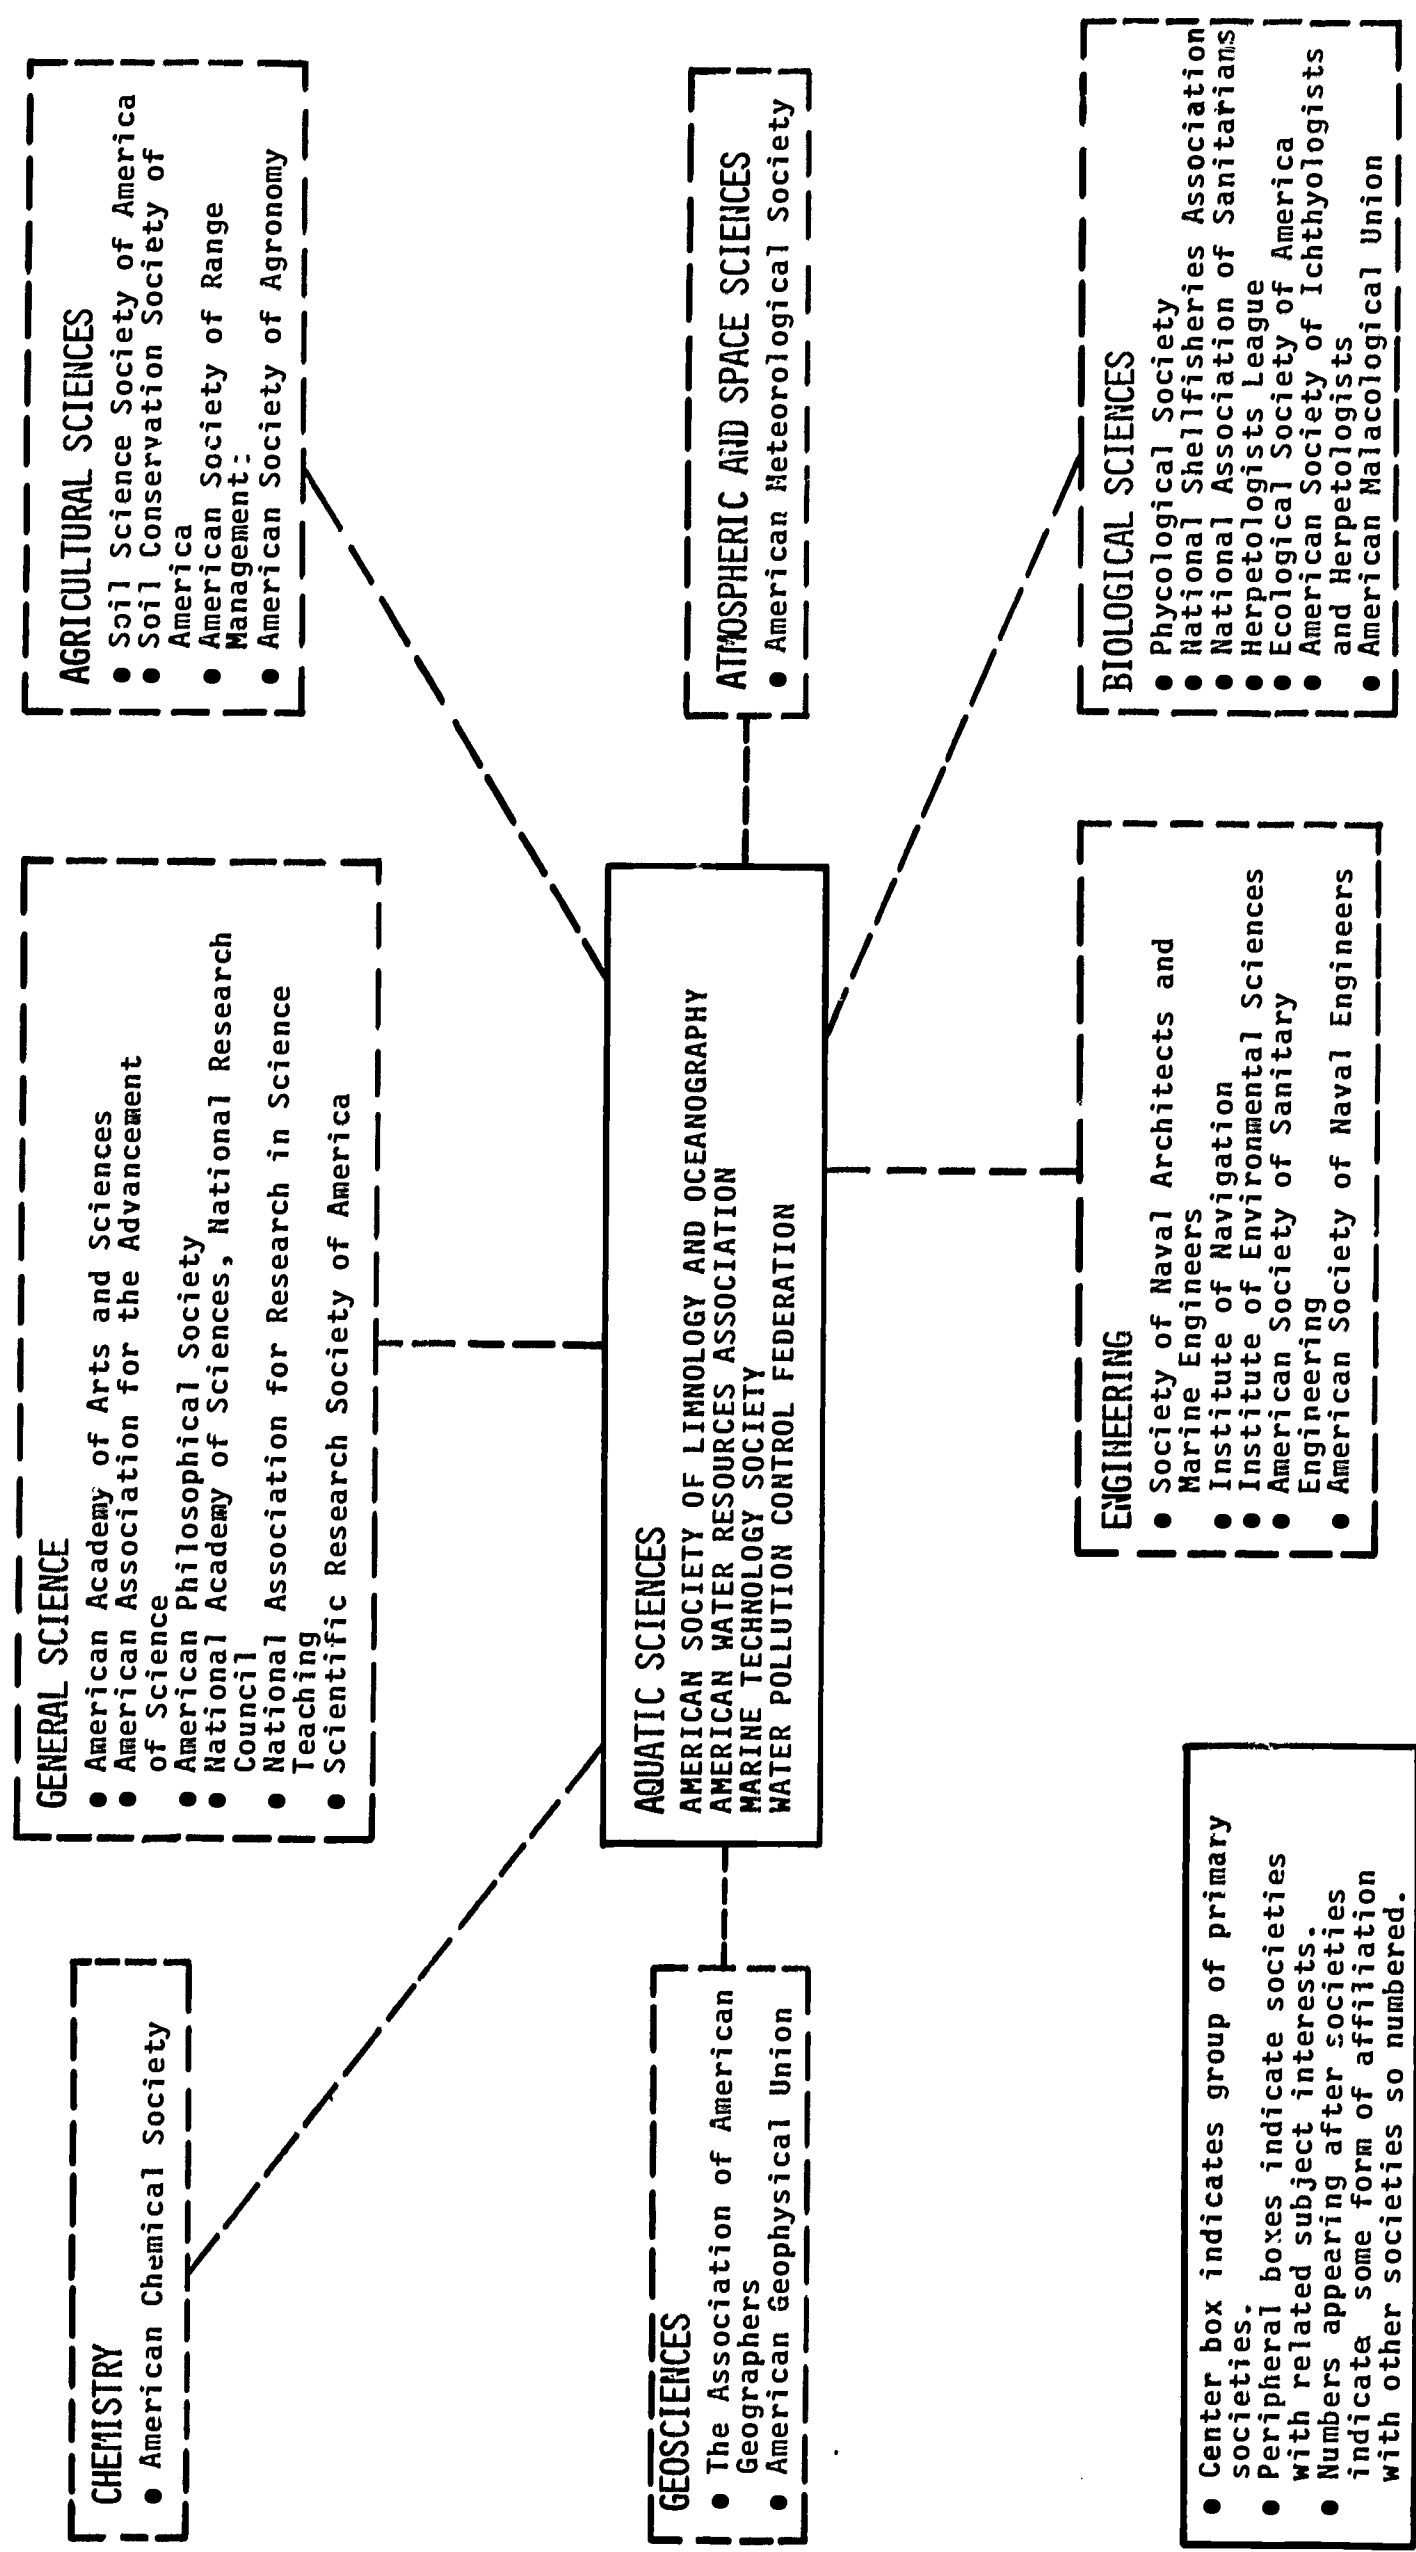

The major role in science information activities in the geosciences is that of the American Geological Institute which not only carries out a major primary, secondary, and special publication program of its own, but is also currently assuming responsibility for the development of a coordinated science information program for most of the geosciences.

## 5. Aquatic Sciences

There are four scientific societies in the United States primarily concerned with the aquatic sciences, and twenty-six others which are concerned with the field secondarily or indirectly. All of the societies related to the aquatic sciences are graphically depicted in Figure 5.

SOCIETIES RELATED TO THE AQUATIC SCIENCES

FIGURE 5

At present, no single society appears to be dominant or central in the aquatic sciences, but the American Water Resources Association would appear to have the greatest potential for assuming such a role.

The largest society in the field is the Water Pollution Control Federation, with 14,600 members. The other three societies have memberships in the 1,000 - 2,000 range.

The Water Pollution Control Federation is also the oldest society in the field, founded in 1928. Reflecting the rapid increase in the interest and activity in aquatic sciences, two of the four societies have been established in the past decade: the Marine Technology Society founded in 1963, and the American Water Resources Association founded in 1964.

The fastest growing society in terms of rate of growth is the American Society of Limnology and Oceanography with an increase in membership of 31 percent over the last three years, and 108 percent over the past decade. In terms of actual members, it also has shown the most growth over the past three years with the addition of 427 members.

The most extensive and comprehensive science information program is that of the American Water Resources Association; however, the four societies identified in the aquatic societies all appear to have relatively separate and distinct areas of interest which relate, but do not overlap.

## 6. Atmospheric and Space Sciences

There are seven\* scientific societies in the United States primarily concerned with atmospheric and space sciences; 19 other societies are indirectly or secondarily concerned with atmospheric and space sciences. All of these societies are graphically depicted in Figure 6.

In terms of individual memberships, the single largest society in the atmospheric and space sciences is the American Institute of Aeronautics and Astronautics with about 40,000 members. The second largest is the American Meteorological Society with 9,000 members.

At the present time, no single organization appears to enjoy a natural position of centrality in the field of atmospheric and space sciences. This may be partly due to the fact that the category contrived for this study does not represent a natural marriage of subject and disciplinary interests. It may also be partly due to the fact that some of these societies have traditional bonds with the other major disciplinary families, for example - the geosciences, which are still reflected in their affiliations and orientation. From the standpoint of its membership and its information programs, as well as its subject coverage, the leading candidate for the society to assume a central position in the atmospheric and space sciences would appear to be the American Institute of Aeronautics and Astronautics.

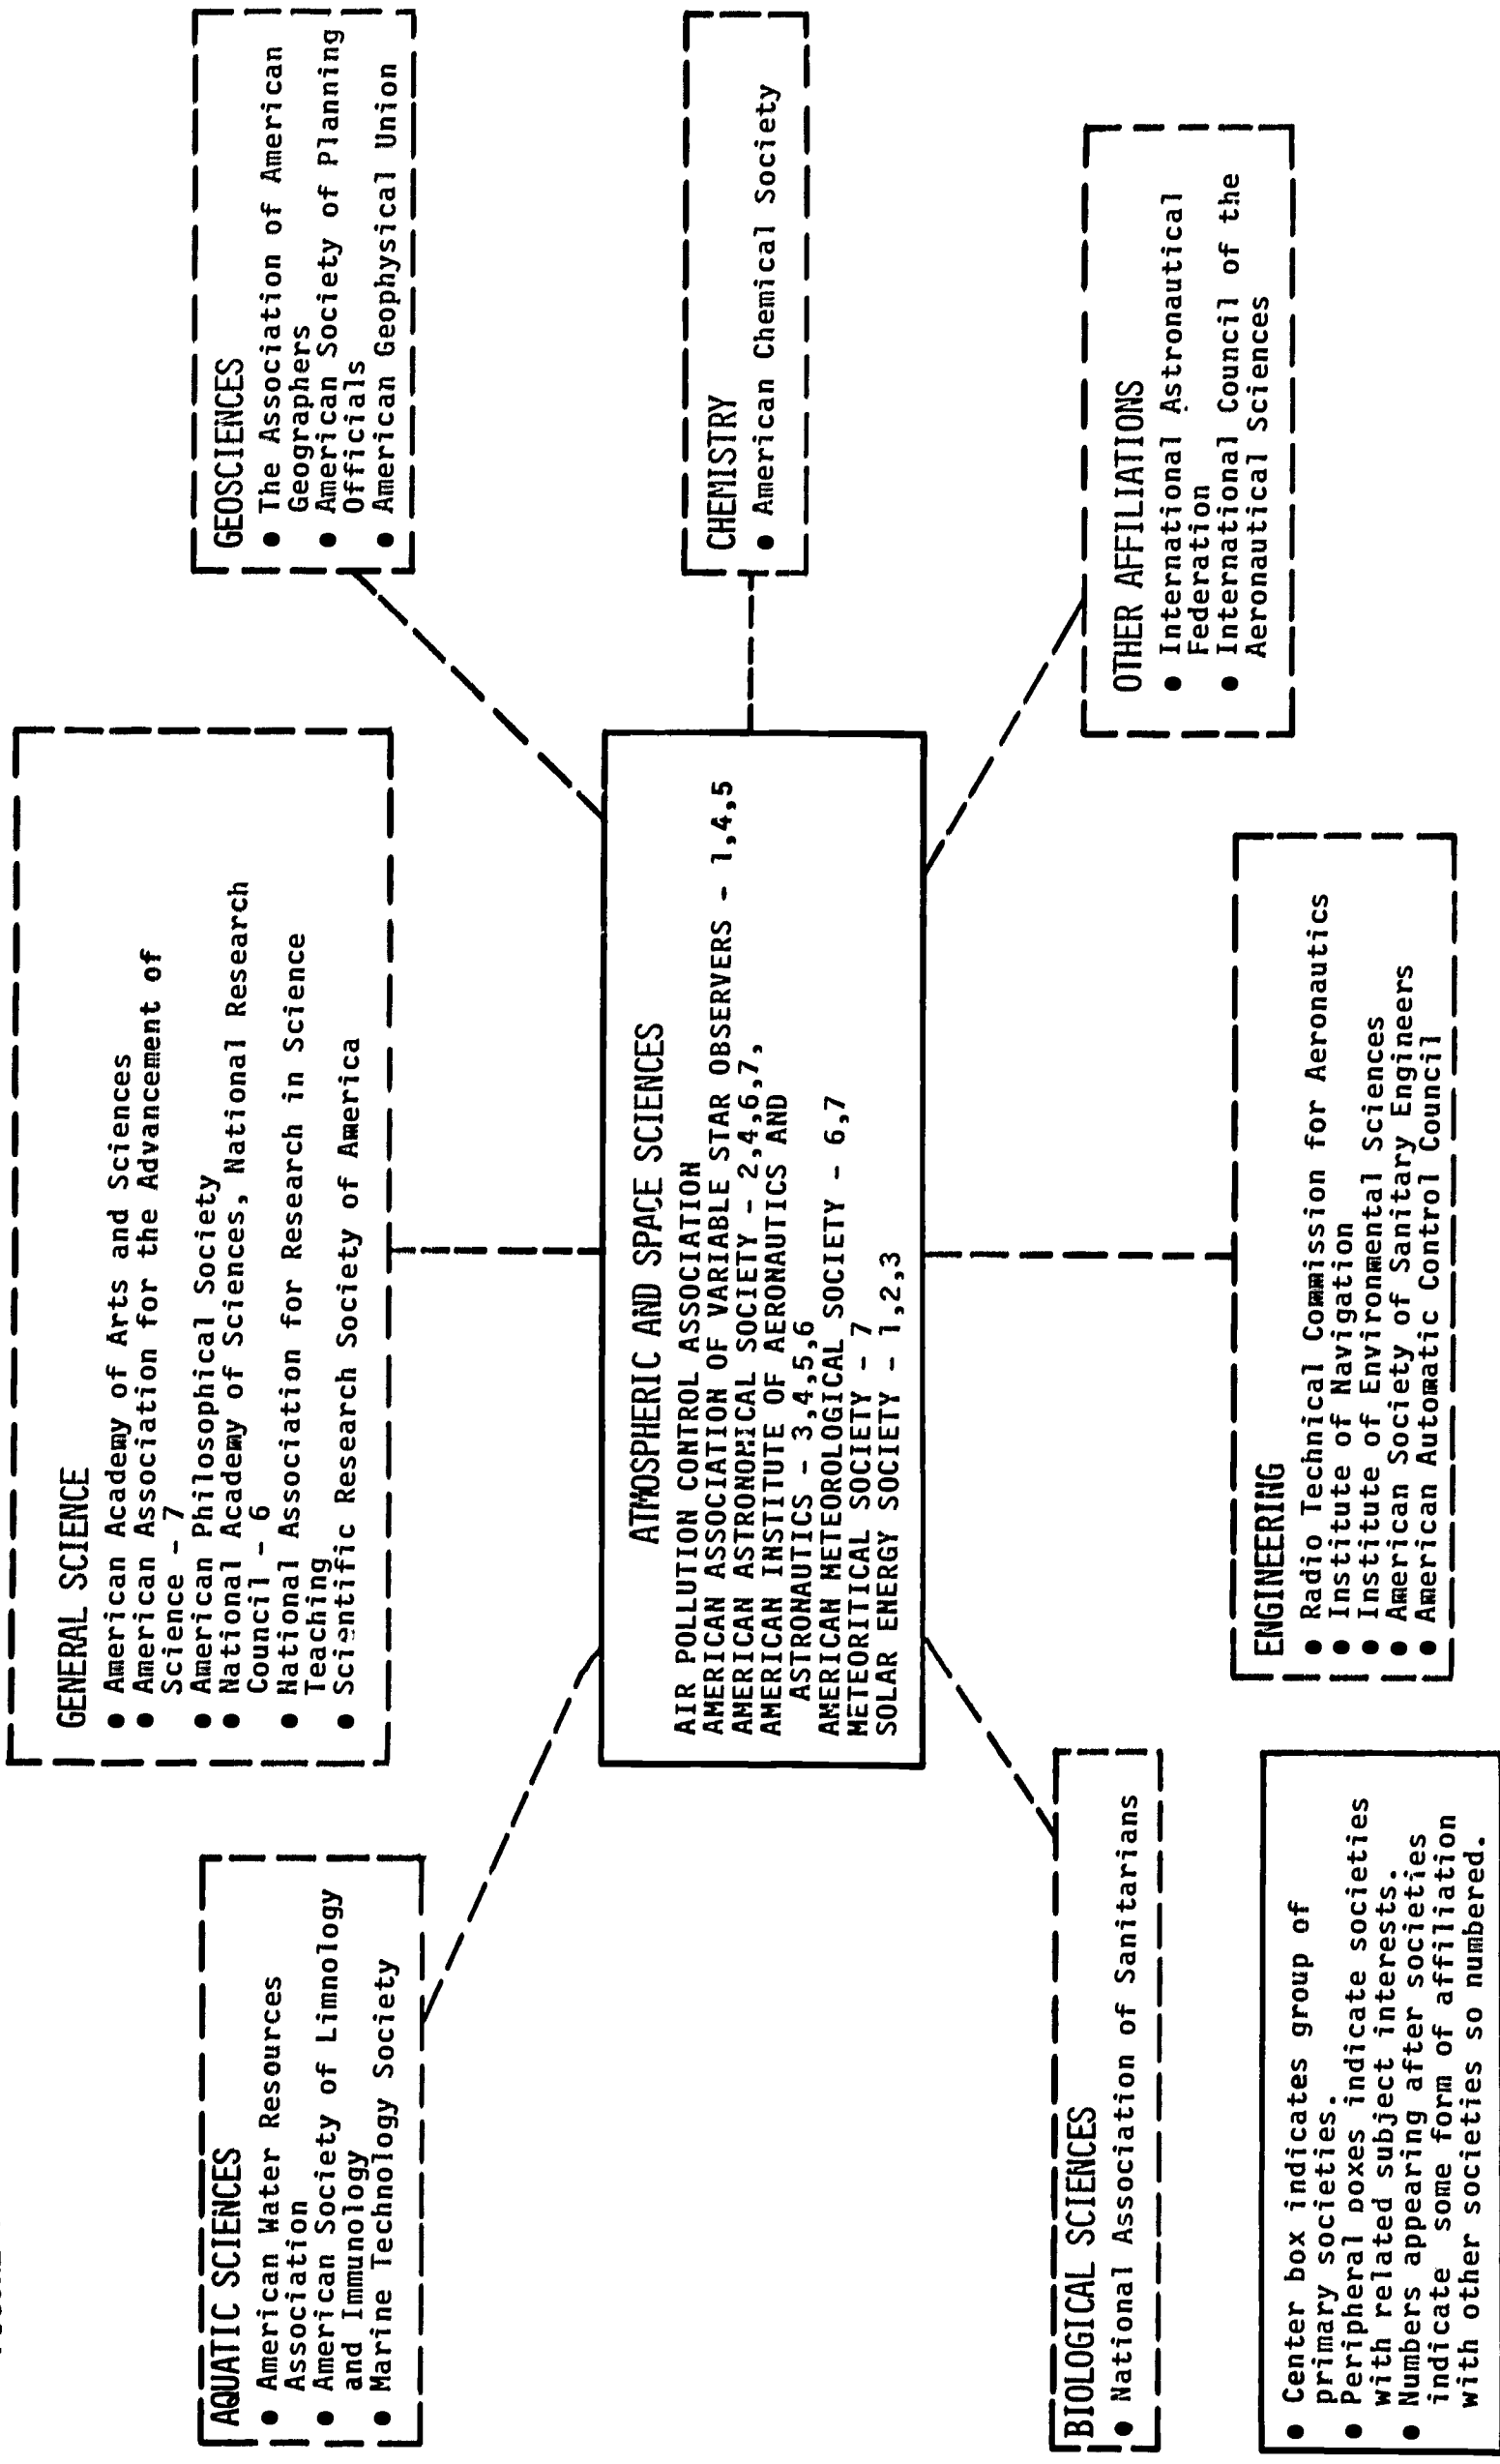

The oldest society in the field is the American Astronomical Society which was founded in 1897. Despite the rapidly growing emphasis on and interest in atmospheric and space sciences, no new societies have been

---

\* The American Astronautical Society is not included in the seven because the information required for its validation was received too late for inclusion.

# SOCIETIES RELATED TO THE ATMOSPHERIC AND SPACE SCIENCES

FIGURE 6

established in the past decade although the American Institute of Aeronautics and Astronautics was formed in 1963, by the merger of the American Rocket Society and the Institute of Aerospace Sciences.

The fastest growing society over the past three years has been the American Institute of Aeronautics and Astronautics which has increased membership by 94 percent. Over the past decade, the American Astronomical Society has had the highest rate of growth with 131 percent increase in membership. In terms of actual numbers, the American Institute of Aeronautics and Astronautics ranks first with the addition of the most new members over the past three years.

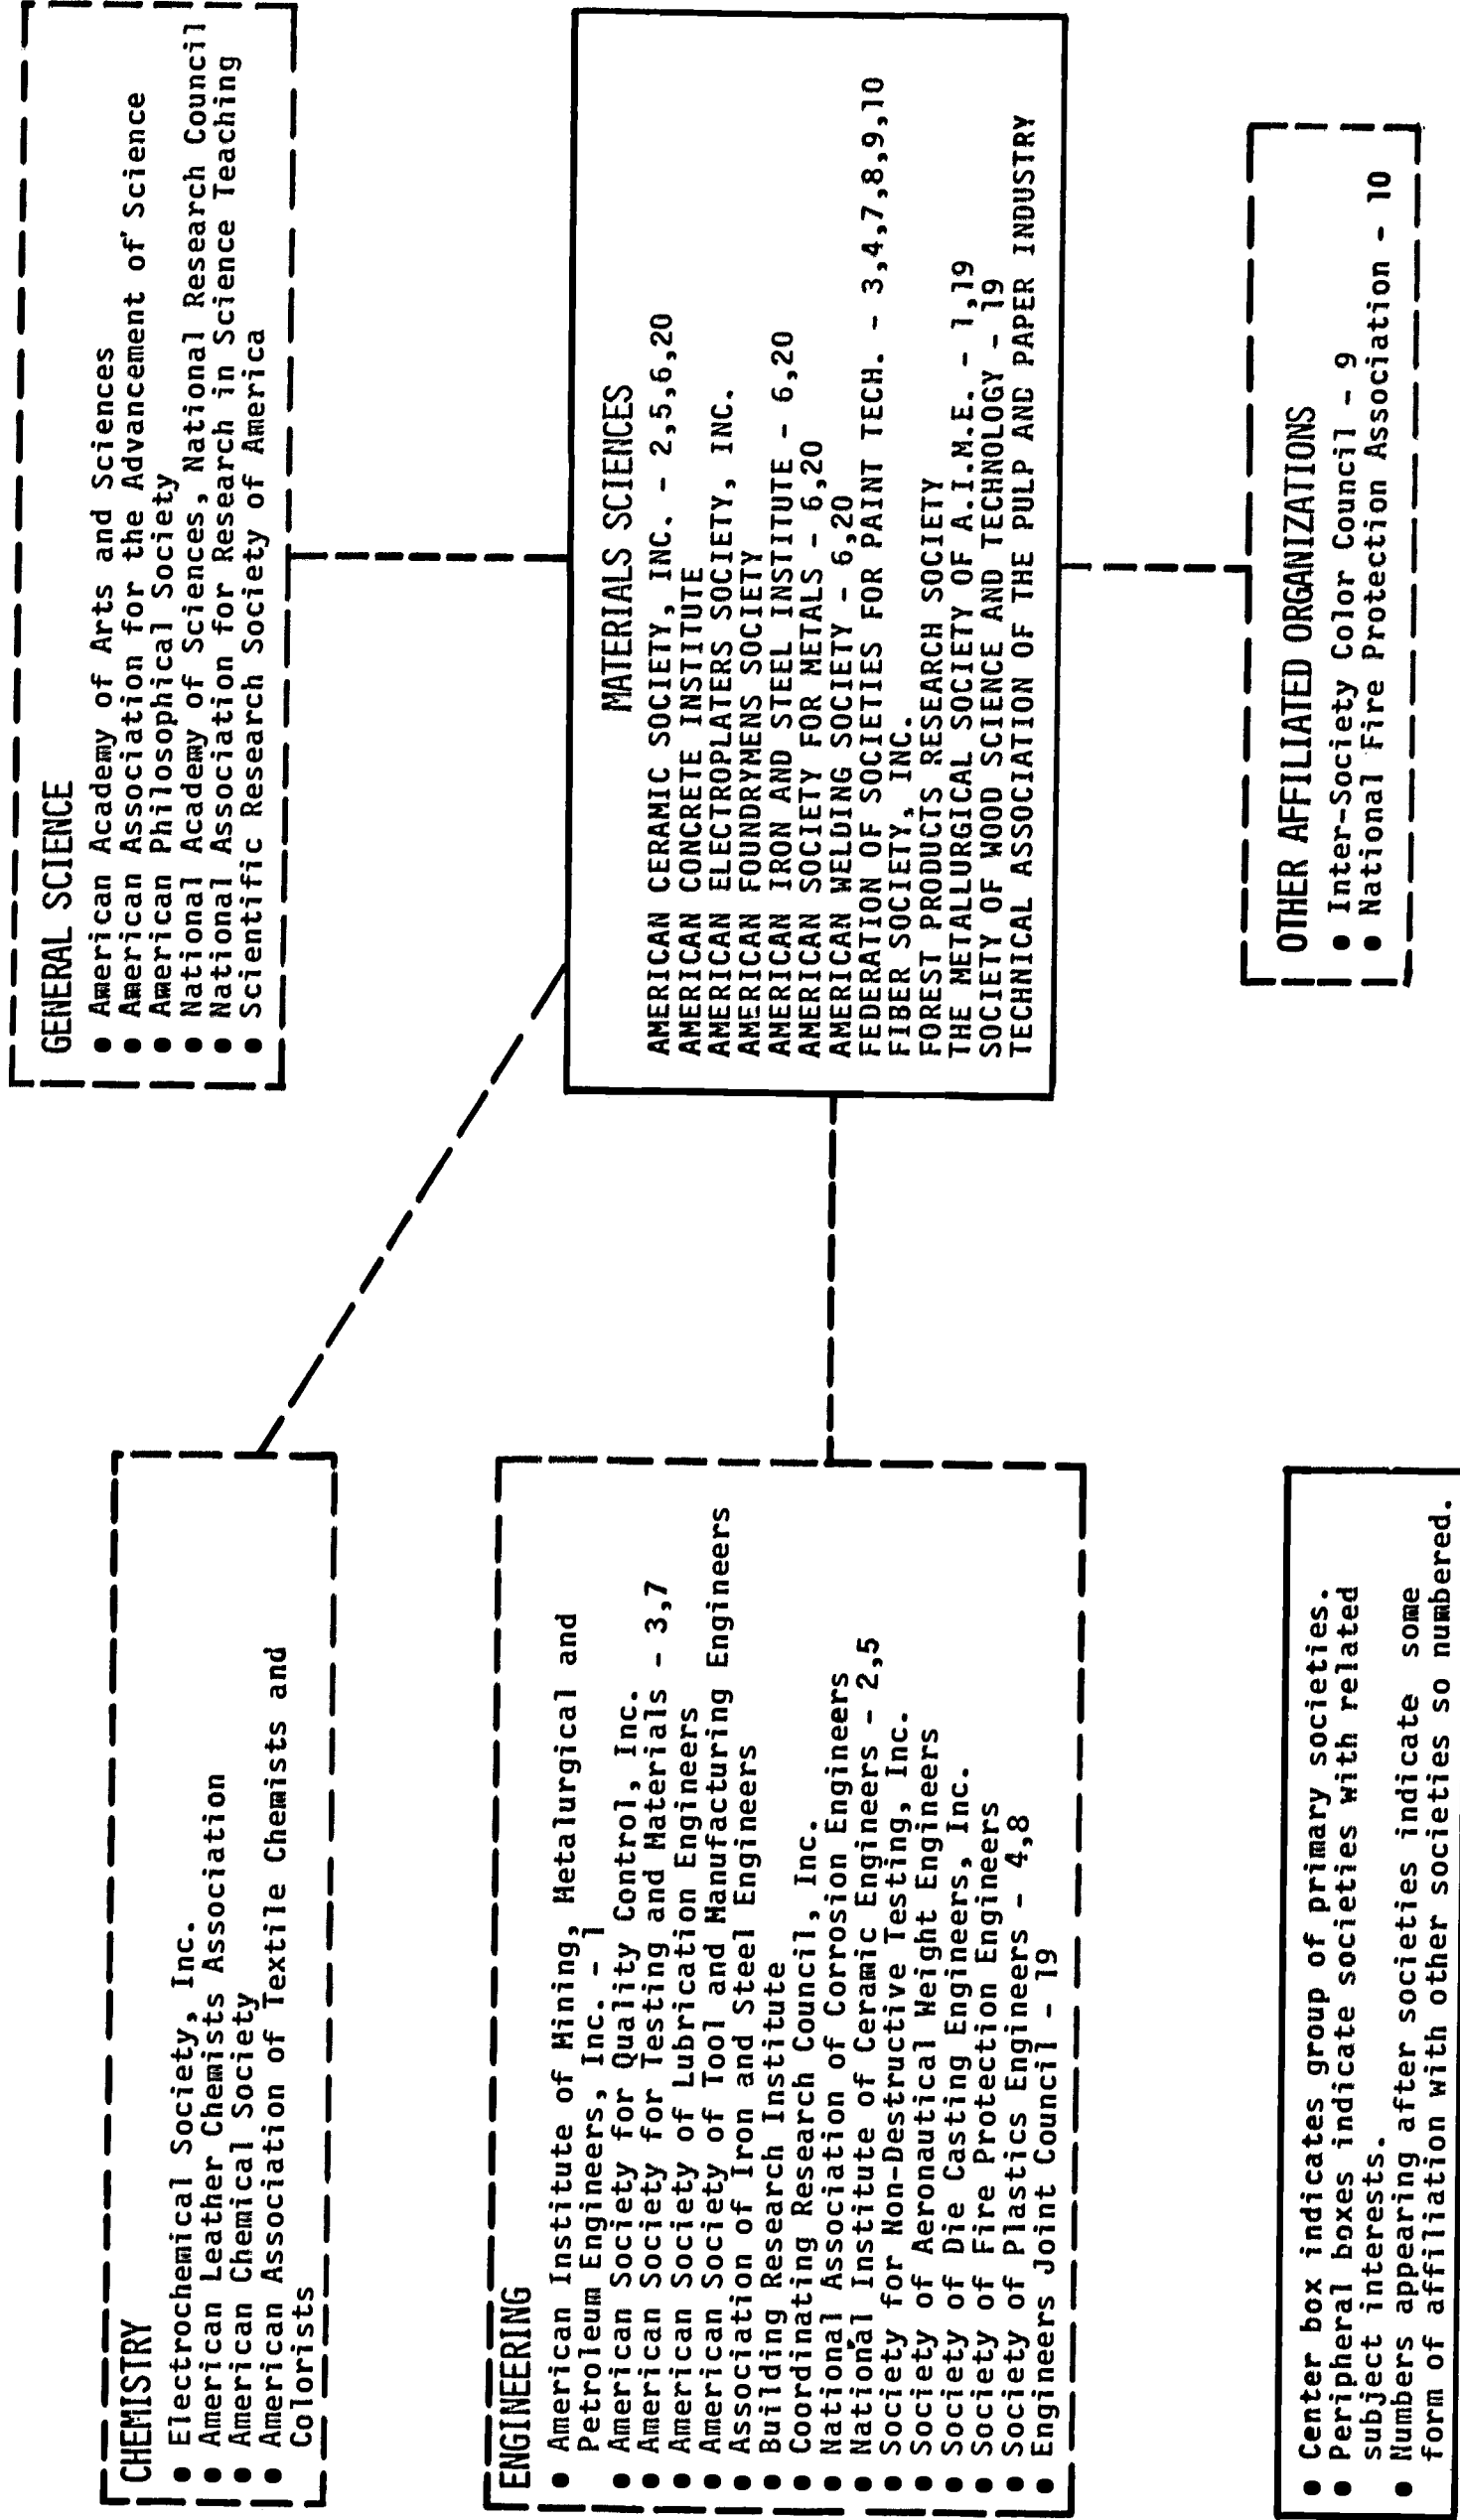

All societies in the field publish some form of periodic scientific information; however, the most extensive science information program covering the broadest range of subject interests in that of the American Institute of Aeronautics and Astronautics (AIAA). The information program of the AIAA is supported by and coordinated with that of the National Aeronautics and Space Administration, and thus provides comprehensive coverage of the open literature and report documentation related to the space sciences.

## 7. Materials Sciences

There are 13 scientific societies in the United States primarily concerned with the materials sciences and 26 other societies are indirectly or secondarily related. The societies associated with the materials sciences are graphically depicted in Figure 7.

# SOCIETIES RELATED TO MATERIALS SCIENCE

FIGURE 7

The American Society for Metals has the most extensive information activity, but none of the societies has a central or comprehensive role in the field of materials sciences. All but a single (the smallest) society maintain an active primary publication activity.

In terms of individual memberships, the single largest society in the materials sciences is the American Society for Metals with 32,000 members, followed by the American Welding Society with 18,500.

The oldest society in the field is the American Iron and Steel Institute which was founded in 1855. One society was established within the past decade, the Society of Wood Science and Technology founded in 1958.

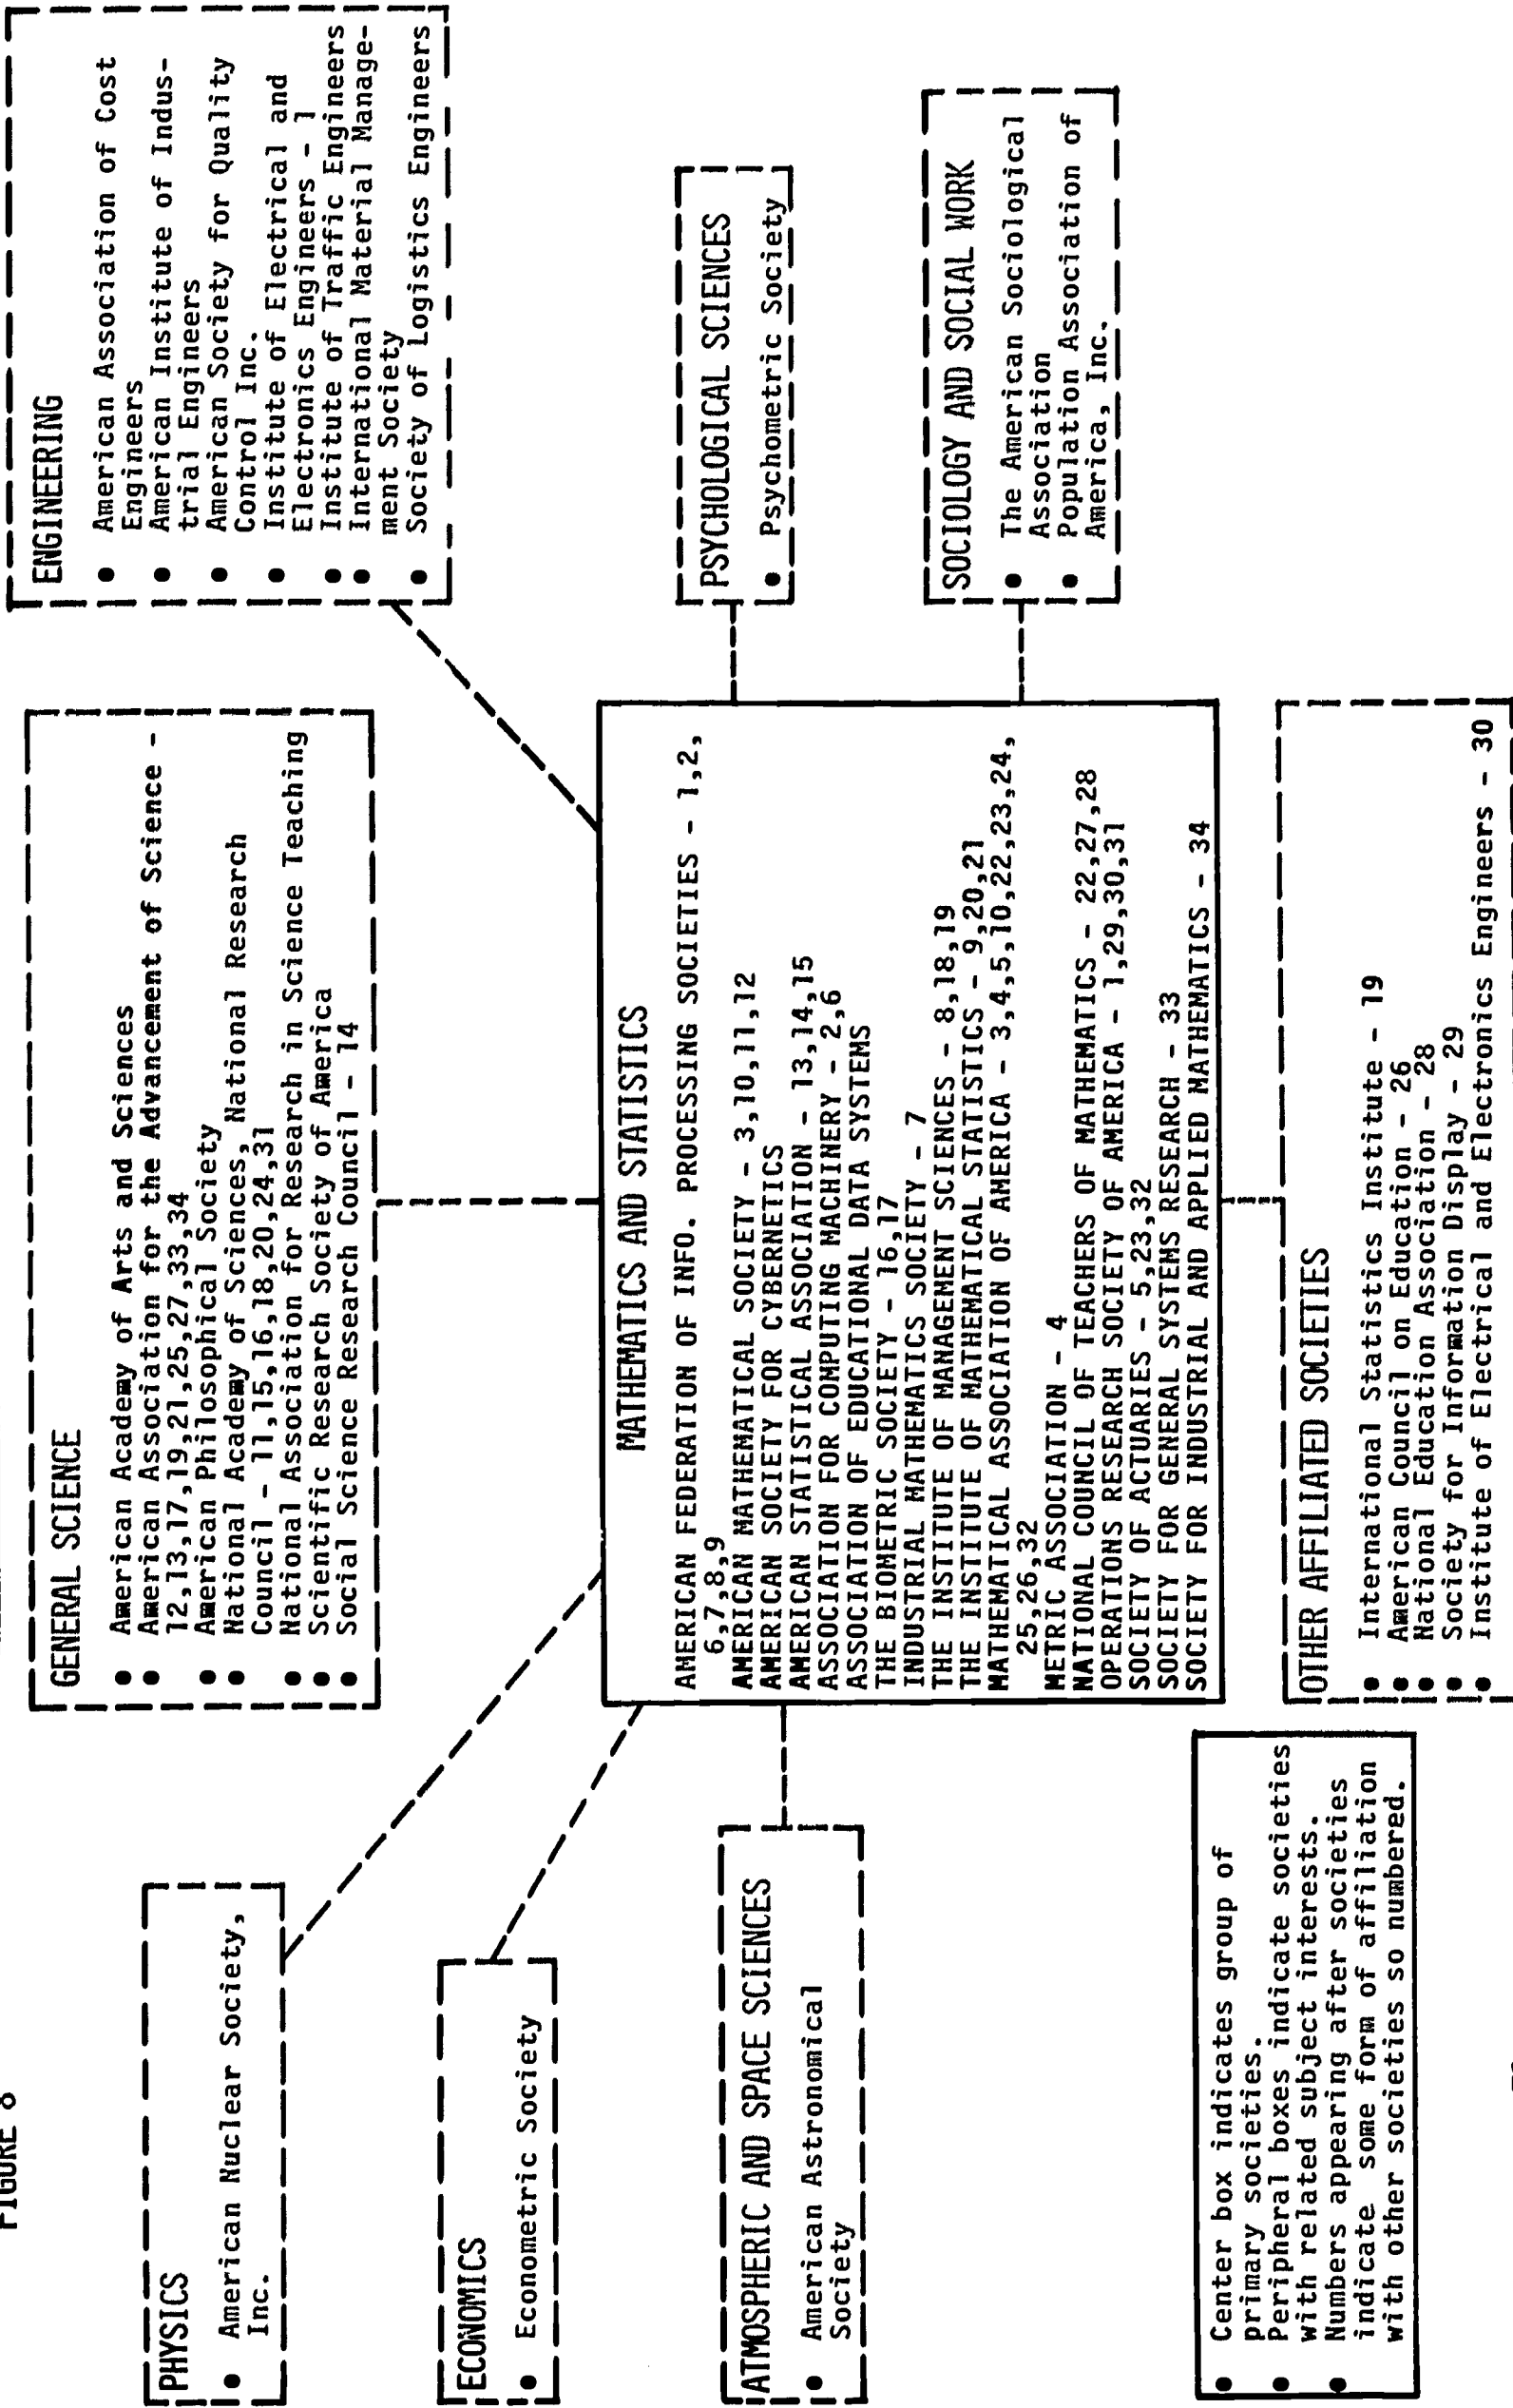

Over the past three years, the Society of Wood Science and Technology has had the most rapid rate of increase in membership, rising by 69%. In terms of actual numbers, the American Welding Society ranks first in the field with the addition of 4500 new members over the past three years.

#### 8. Mathematics and Statistics

There are seventeen scientific societies in the United States primarily concerned with mathematics and statistics. Twenty other societies are secondarily or indirectly related. All of the societies associated with mathematics and statistics are graphically depicted in Figure 8.

FIGURE 8

SOCIETIES RELATED TO MATHEMATICS AND STATISTICS

From the standpoint of discipline coverage and information activities, the American Mathematical Society is the most central society within the field; however, the American Mathematical Society is not particularly dominant with respect to size of membership, affiliations with other societies, or current growth.

Within the field of mathematics and statistics, the single largest society is the National Council of Teachers of Mathematics with 76,000 members. The second largest society is the Association for Computing Machinery with 21,000 members.

The oldest society is the American Statistical Association which was founded in November 1839. Two new societies, formed in the last decade, are the Association of Educational Data Systems (1962) and the American Society for Cybernetics (1966).

The fastest growing society in the field at the present time is the National Council of Teachers of Mathematics which has increased membership by 153% the last three years. Over the past decade, the Association for Computing Machinery has increased membership 337%. In terms of actual number of new members in the past three years, the National Council of Teachers of Mathematics ranks highest.

Several societies play prominent roles in the publication and dissemination of scientific information. Prominent are the Association for Computing Machinery, the Operations Research Society of America, and the Society for Industrial Applied Mathematics; however, the single most comprehensive primary and secondary publication program is that of the American Mathematical Society.

## 9. Agricultural Sciences

There are 17 scientific societies in the United States principally concerned with the agricultural sciences; 31 other societies are secondarily or indirectly related. All of these societies are illustrated in Figure 9.

In the agricultural sciences, there is no single scientific society with subject interests spanning the entire field such as exists in chemistry and mathematics. Neither is there a formal affiliation existing among most of the societies, although there are numerous examples of specific affiliations among two or three societies.

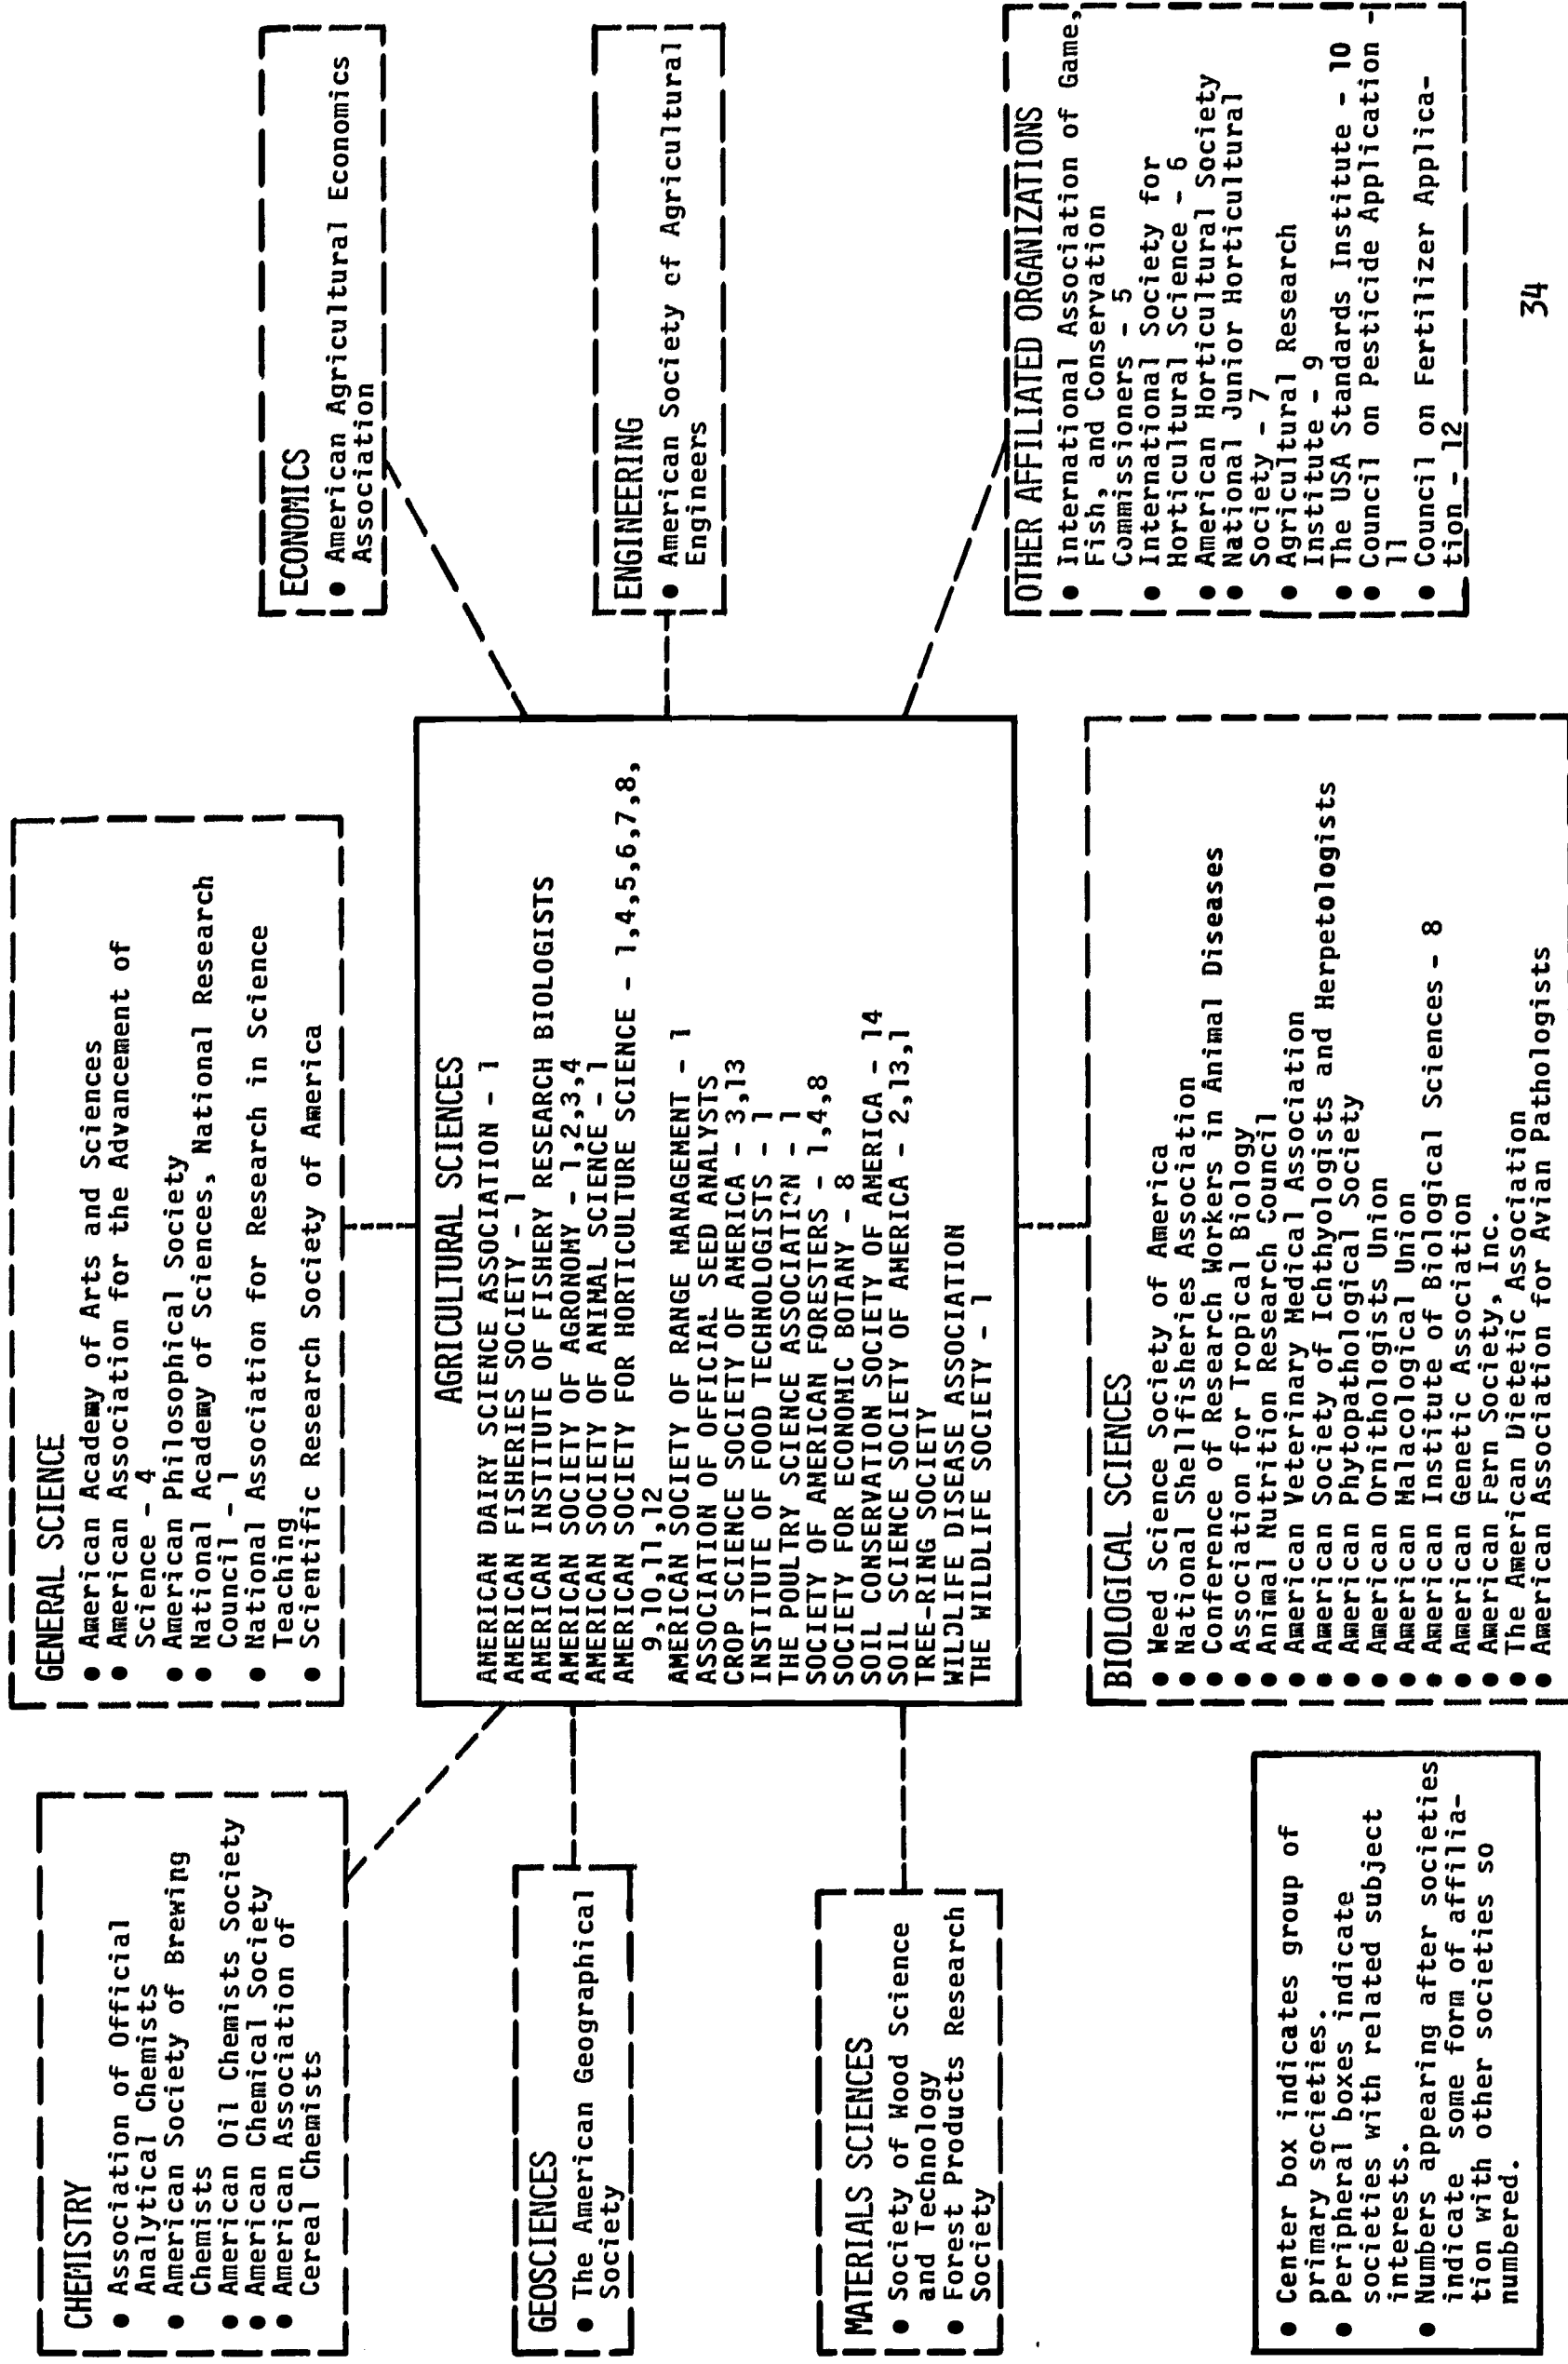

The largest society in the field is the Society of American Foresters with 16,225 members, followed by the Soil Conservation Society of America with 11,400 members.

The American Fisheries Society which was founded in 1870 is the oldest society in the field. No new society has been established in the past decade.

Over the past three years the Association of Seed Analysts has had the most rapid rate of growth with a 75% increase in membership. Over the past decade, the American Institute of Fishery Research Biologists has grown the fastest with 167% increase in its membership. Over the past three years, the Wildlife Society has added the most new members with 2,145 new members, followed by the Society of American Foresters which has added 1,990 new members.

FIGURE 9

SOCIETIES RELATED TO AGRICULTURAL SCIENCES

No single society stands out in the agricultural sciences as performing science information functions broadly related to the entire field. The major bibliographic tool is the Bibliography of Agriculture produced by the National Agricultural Library and not by a scientific society.

#### 10. Biological Sciences

There are 68 societies in the United States primarily concerned with the biological sciences. There are 48 other societies secondarily or indirectly related to biological sciences. All of these societies are illustrated in Figure 10.

The American Institute of Biological Sciences (AIBS) appears to be the central society in the field primarily because of its breadth of subject coverage and its affiliations. Its affiliations include 43 other biological societies as members of the AIBS, thus making AIBS, in effect, an umbrella society in the field.

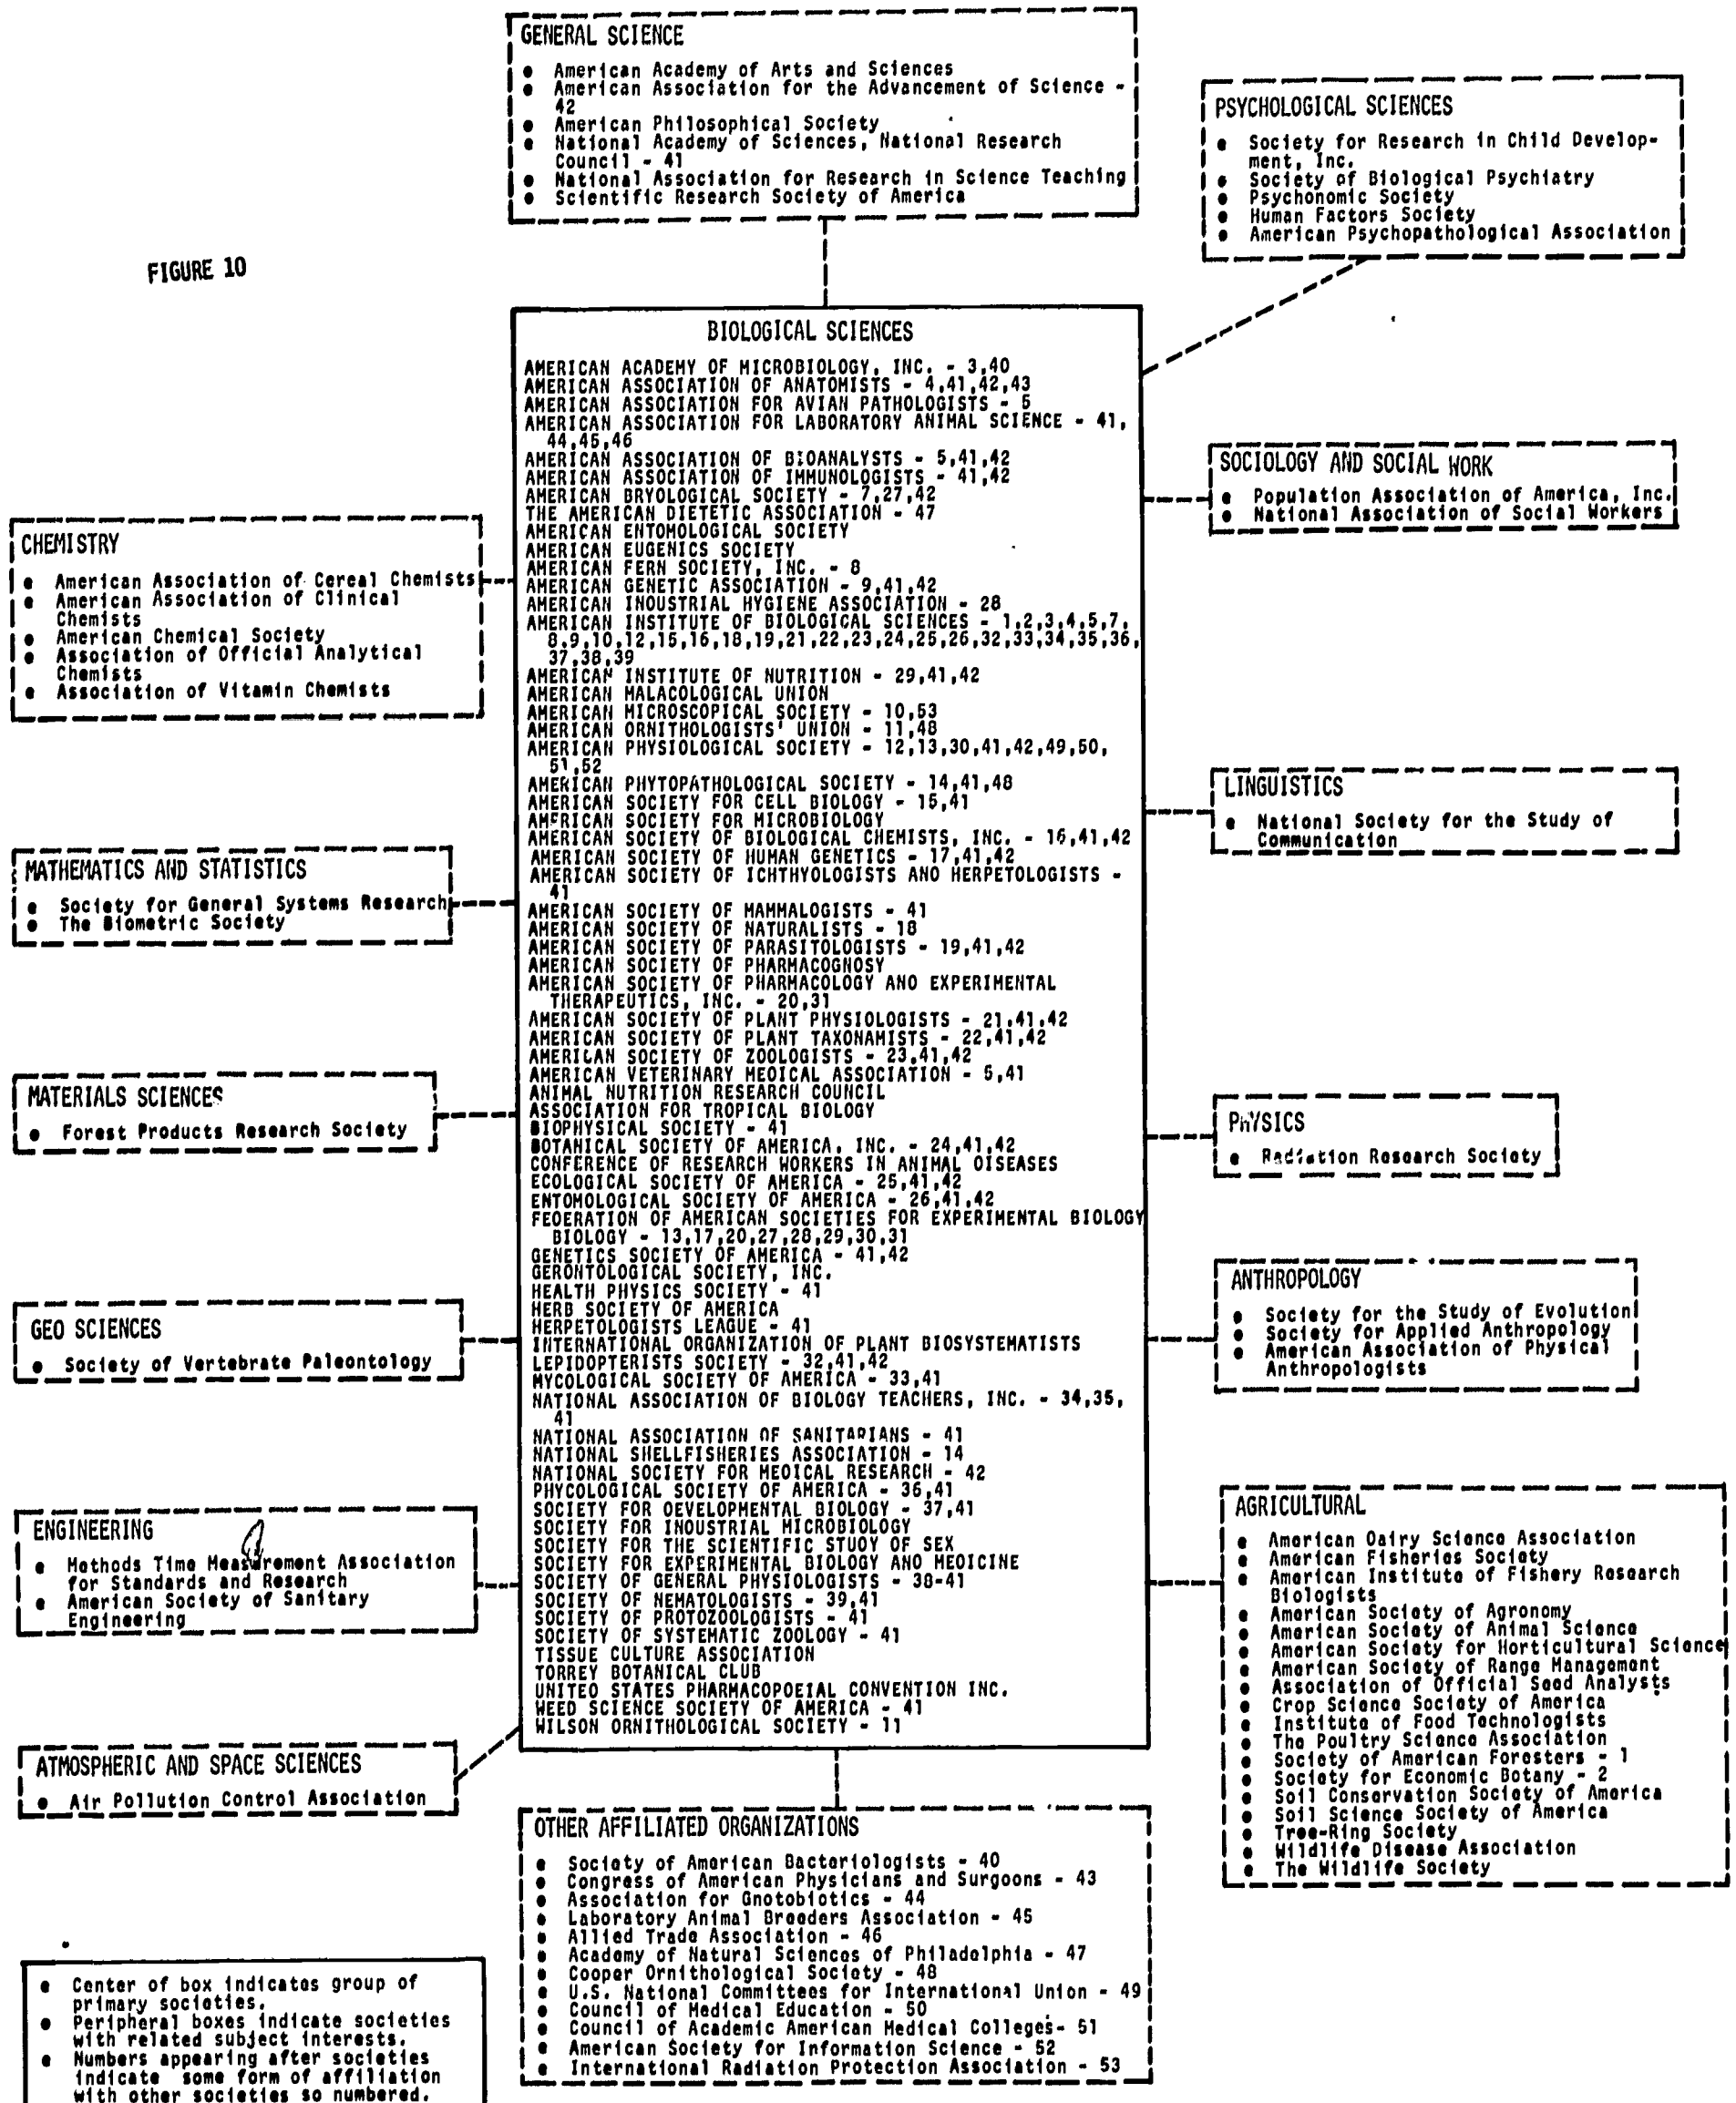

The American Dietetic Association is the largest society in the biological sciences with 19,400 members. The second largest is the American Veterinary Medical Association with 18,300 members. The third largest society is the American Institute of Biological Sciences with 13,600 members (individuals).

The oldest society in the field is the United States Pharmacopoeial Convention, Inc., founded in 1820. During the past decade, four new societies have been founded in the biological sciences; namely, the American Society for Cell Biology founded in 1960, the Society of Nematologists founded in 1961, the International Organization of Plant Biosystematists founded in 1962, and the Association for Tropical Biology founded in 1963.

## SOCIETIES RELATED TO THE BIOLOGICAL SCIENCES

FIGURE 10

During the past decade, the most rapid growth has been experienced by the American Association for Laboratory Animal Science with a 450% increase in membership. In terms of actual new members, the American Society for Microbiology ranks highest in the field with 4,450 new members in the past three years.

No single society stands out in the biological sciences with respect to science information programs. Most of the individual societies produce various primary and secondary publications related to their specific interests, but the main bibliographic tool in the field, Biological Abstracts, is not produced by a scientific society.

## 11. Psychological Sciences

There are 14 societies in the United States principally concerned with the psychological sciences; 18 other societies are indirectly or secondarily concerned with the field. Figure 11 identifies all of the societies associated with the psychological sciences.\*

From the standpoint of its subject centrality, its science information functions, and its number of members, the American Psychological Association (APA) readily stands out as the central and most dominant society in the psychological sciences. The APA has 25,800 members. All of the other societies in the field are quite small with total memberships under 2,000.

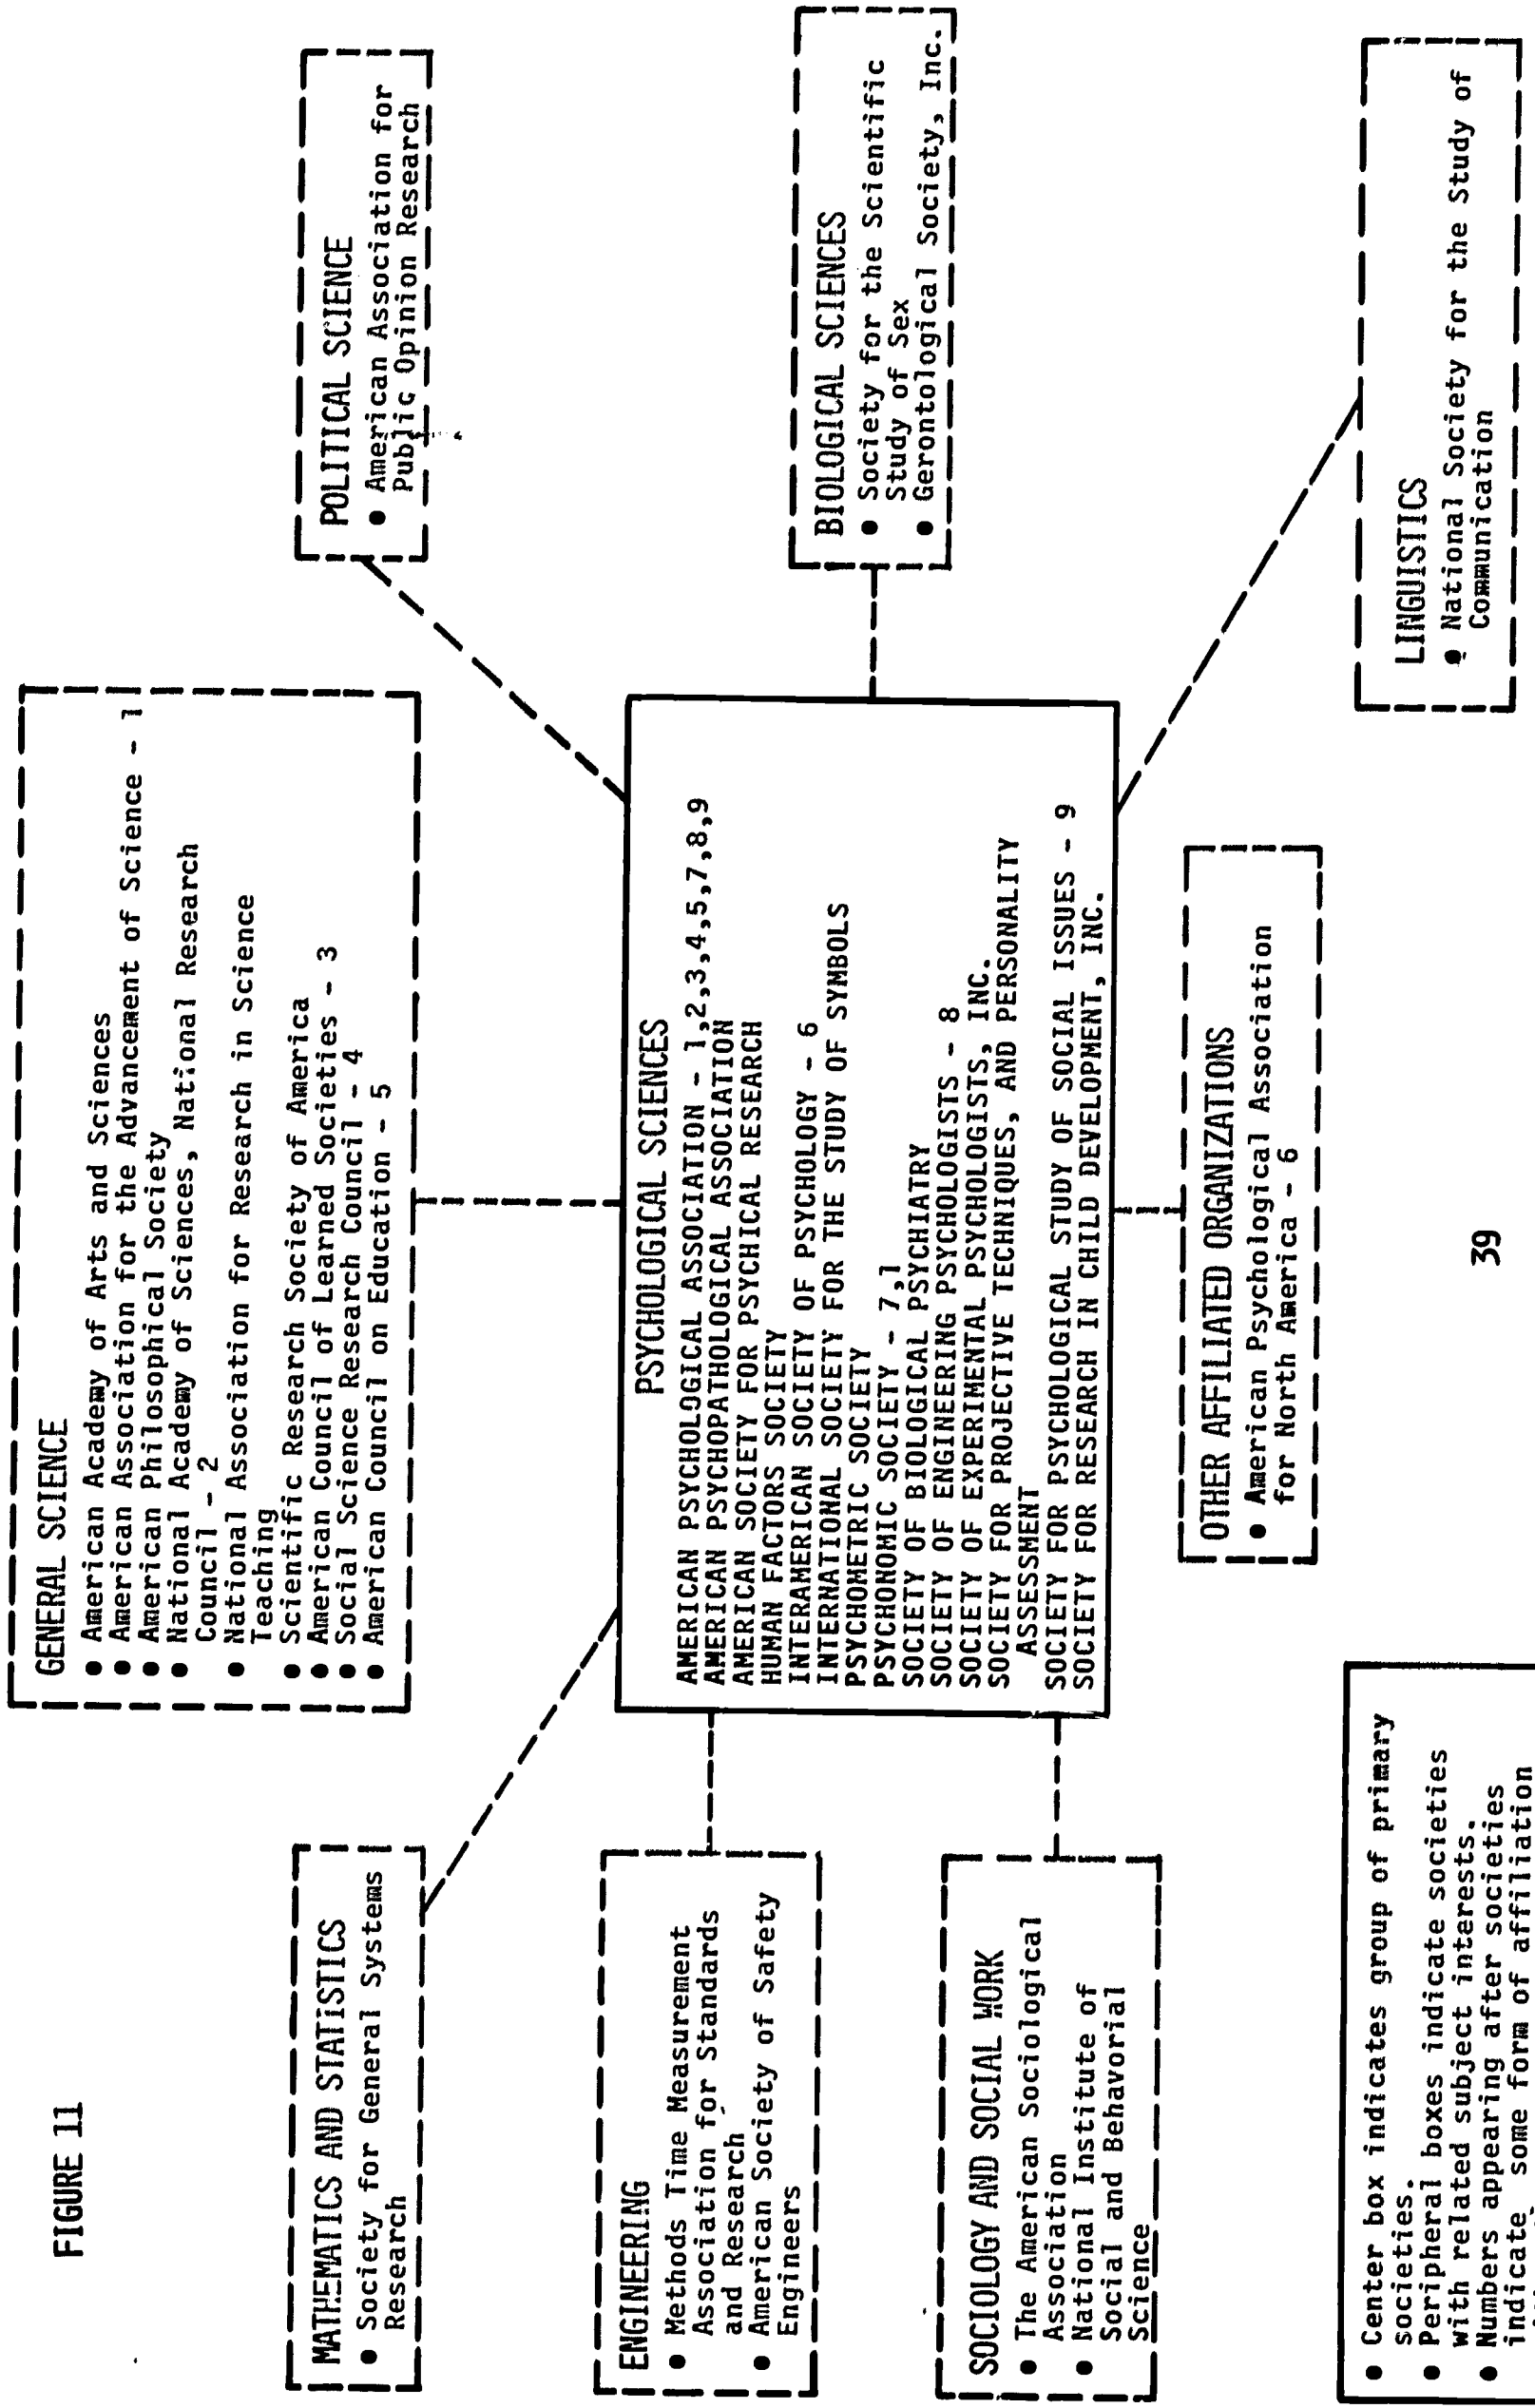

The oldest society in the field is the American Society for Psychical Research founded in 1885. Two new societies have been established in the past decade: The Psychonomic Society founded in 1959, and the International Society for the Study of Symbols which was founded in 1963.

Over the past decade, the Human Factors Society had the most rapid growth with a rise of 225%. Over the past three years, the American Psychological Association has actually increased its membership the most, adding 5,835 new members.

---

\* The Society of Engineering Psychologists and the Society for Psychological Study of Social Issues are actually divisions of the American Psychological Association, but have separate identities and requirements for membership.

# SOCIETIES RELATED TO PSYCHOLOGICAL SCIENCES

The American Psychological Association performs the major science information functions for the field through its primary publications and its major bibliographic publication (Psychological Abstracts).

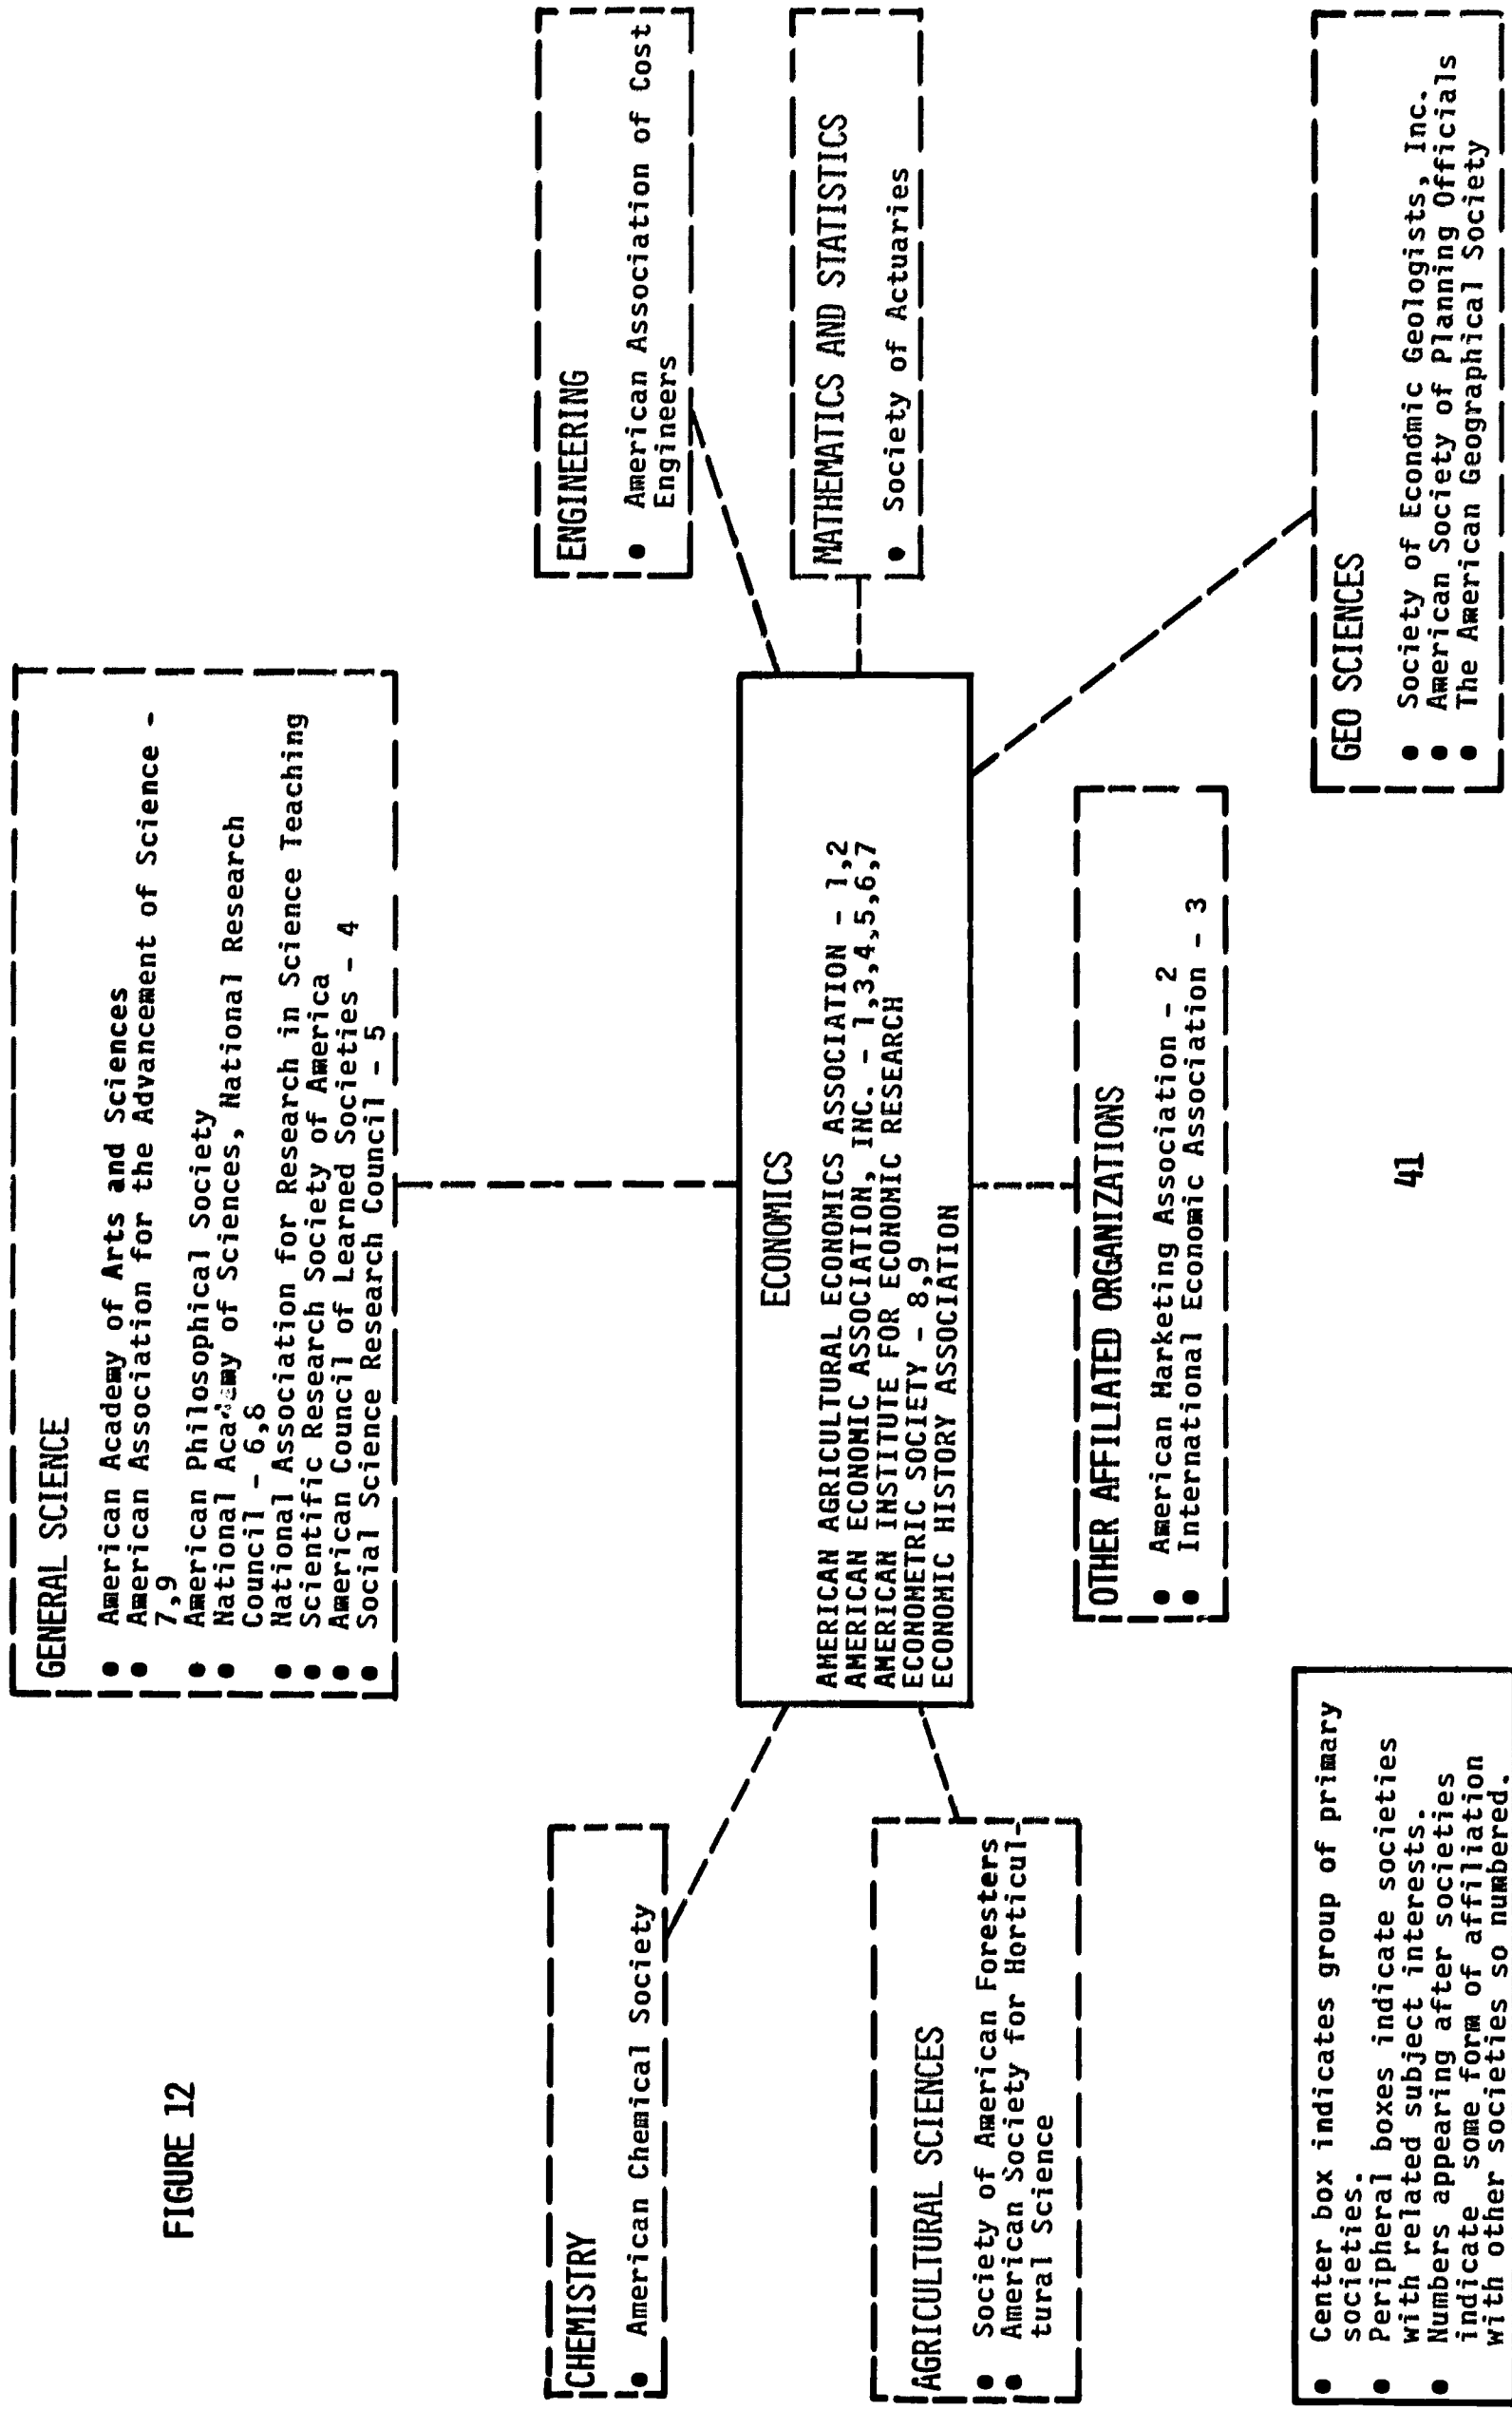

## 12. Economics

There are five scientific societies in the United States primarily concerned with economics and 16 other societies that are indirectly or secondarily related. The societies associated with economics are graphically depicted in Figure 12.

The American Economic Association, Inc. is the most central society in the field of economics by virtue of its affiliations with national advisory groups, its discipline coverage, and the number and diversity of its publications. It is the oldest society in the field (founded in 1885), has had the largest increase in membership (3,650) and the fastest rate of growth in the past decade (75.8%). The American Institute for Economic Research with approximately one-third as many members also appears to have broad discipline coverage and a strong primary publications program.

In terms of individual memberships, the single largest society in economics is the American Economic Association, Inc. with 16,675 members, followed by the American Institute for Economic Research with 5,000 members.

## SOCIETIES RELATED TO ECONOMICS

Center box indicates group of primary societies.  
Peripheral boxes indicate societies with related subject interests.  
Numbers appearing after societies indicate some form of affiliation with other societies so numbered.

### 13. Sociology and Social Work

There are five scientific societies in the United States primarily concerned with sociology and social work. Twenty-two other societies are secondarily or indirectly related. All of the societies associated with sociology and social work are graphically depicted in Figure 13.

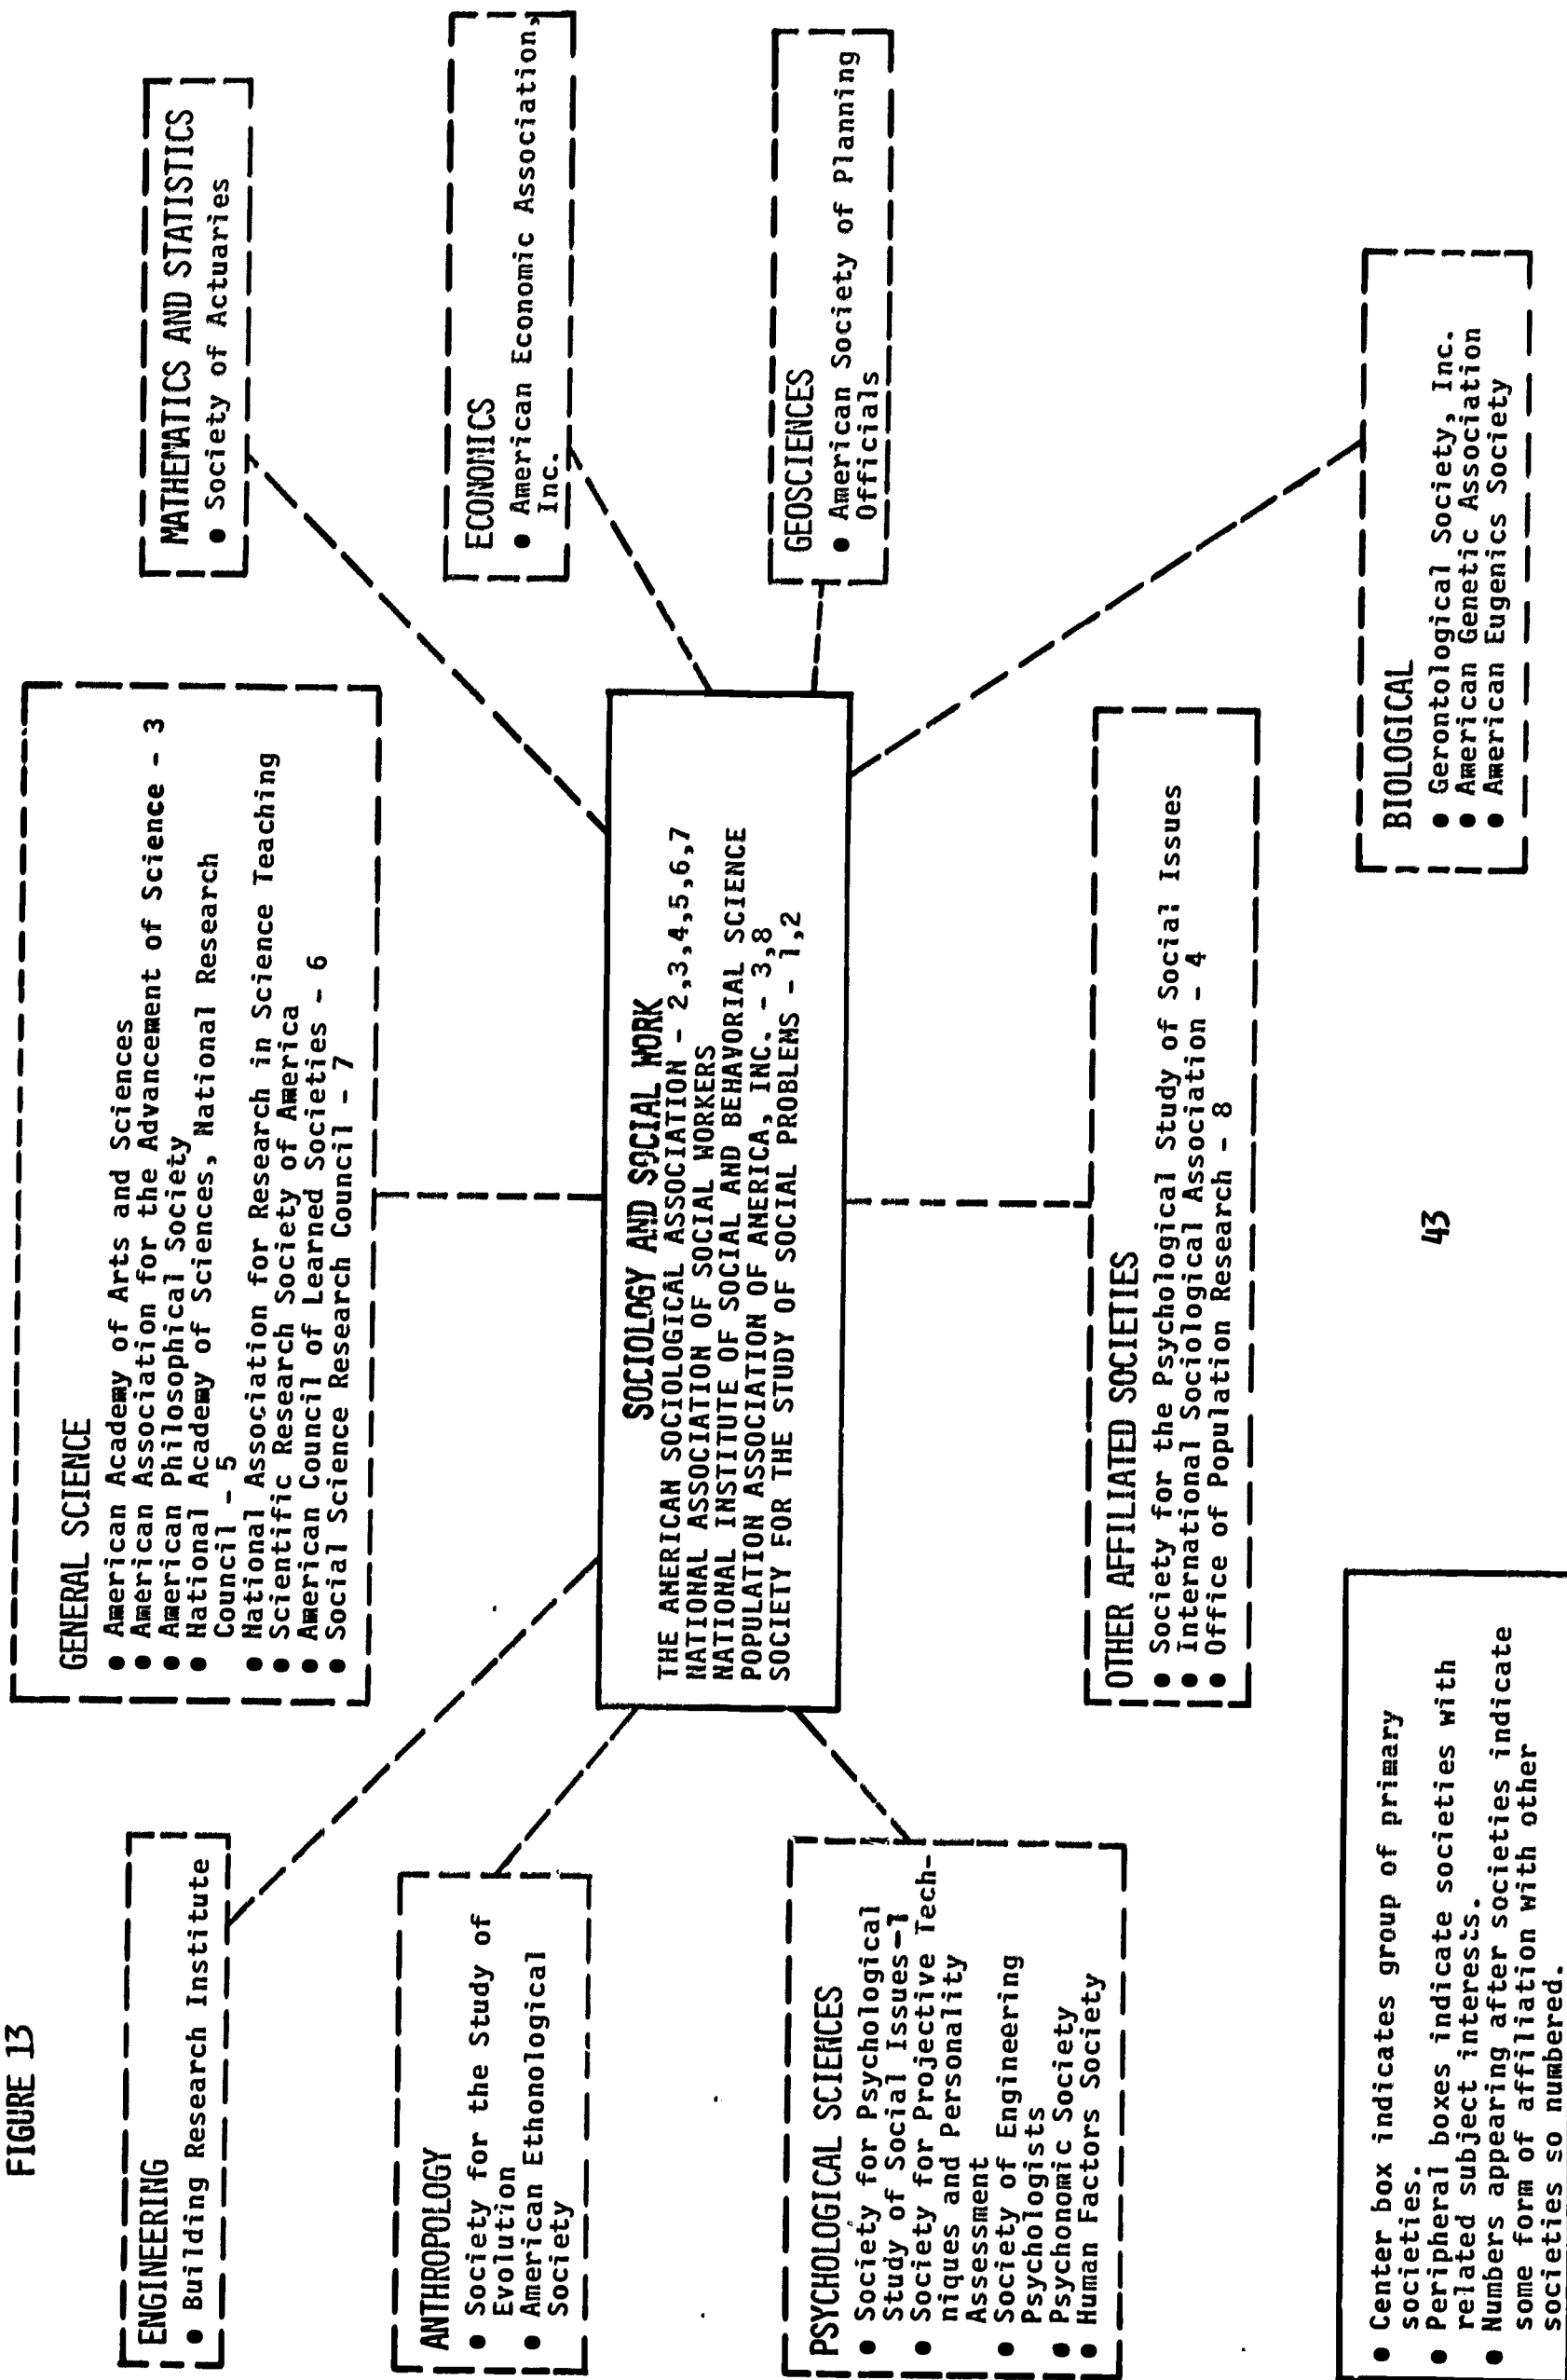

From the standpoint of discipline coverage and information activities, the American Sociological Association is the most central society within the field and also has the most affiliations. The American Sociological Association with 11,300 members is not particularly dominant with respect to size of membership. Within the grouping, the single largest society is the National Association of Social Workers with 42,000 members.

The oldest society is the American Sociological Association which was founded in 1905, as the American Sociological Society and became the American Sociological Association in 1959. According to the data collected, no new society has been formed in the past decade in the area of sociology and social work.

# SOCIETIES RELATED TO SOCIOLOGY AND SOCIAL WORK

FIGURE 13

The fastest growing society in the family is the Population Association of America which has increased membership by 200% in the last decade. In terms of actual number of new members, the National Association of Social Workers ranks highest with the addition of 7,000 new members in the past three years.

The American Sociological Association plays a prominent role in the publication and dissemination of scientific information.

#### 14. Anthropology

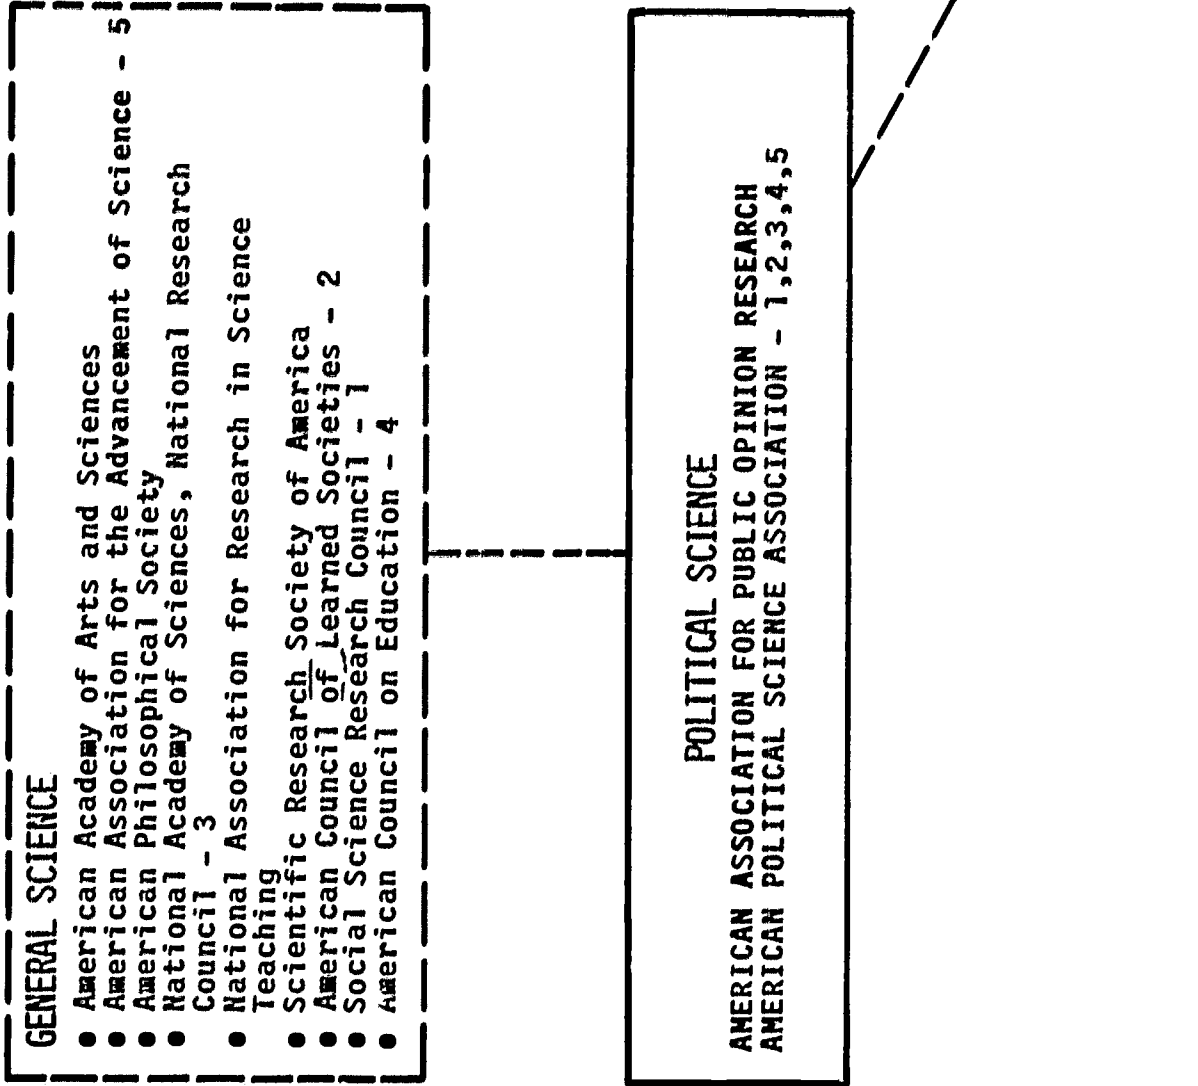

There are five scientific societies in the United States primarily concerned with anthropology. Six other societies are secondarily or indirectly related. All of the societies associated with anthropology are graphically depicted in Figure 14.

From the standpoint of discipline coverage, information activities, size of membership, and affiliations with other societies, the American Anthropological Association is the most central society within the field.

Within the field of anthropology, the single largest society is the American Anthropological Association with 6,240 members. The second largest society is the Society for Applied Anthropology with 3,102 members.

# SOCIETIES RELATED TO POLITICAL SCIENCE

FIGURE 17

- Center box indicates group of primary societies.
- Peripheral boxes indicate societies with related subject interests.
- Numbers appearing after societies indicate some form of affiliation with other societies so numbered.

From the standpoint of discipline coverage and information activities, the American Political Science Association is the most central society within the field. It also is the oldest society in political science (founded in 1903), has the largest membership (16,500), the most new members in the past three years, the fastest rate of growth over the past decade (139%), and the most affiliations with other societies.

#### 18. Philosophy and History of Science

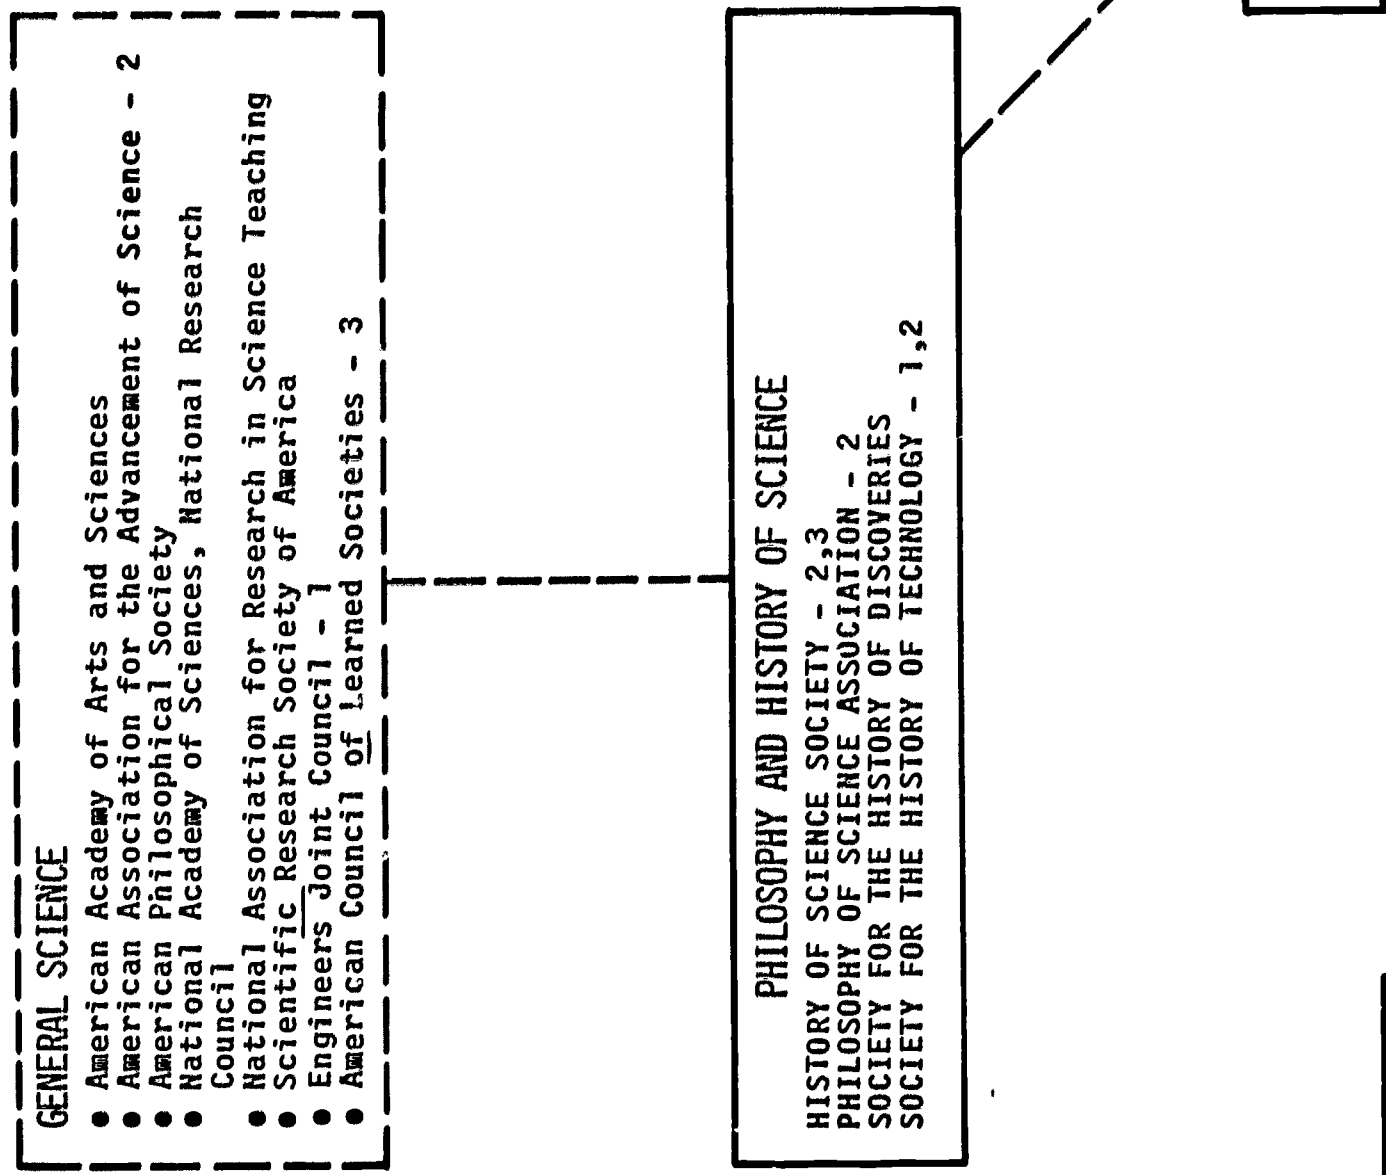

There are four scientific societies in the United States primarily concerned with the philosophy and history of science and nine other societies that are indirectly or secondarily related. The societies associated with philosophy and history of science are graphically depicted in Figure 18.

In terms of individual memberships, the single largest society is the Philosophy of Science Association with 2,000 members, followed by the Society for the History of Technology with 1,400 members, and the History of Science Society with 1,200 members.

The oldest society in the field is the History of Science Society which was founded in 1924. New societies established within the past decade are the Society for the History of Discoveries founded in 1960, and the Society for the History of Technology founded in 1958.

SOCIETIES RELATED TO PHILOSOPHY AND HISTORY OF SCIENCE

FIGURE 18

• Center box indicates group of primary societies.  
 • Peripheral boxes indicate societies with related subject interests.  
 • Numbers appearing after societies indicate some form of affiliation with other societies so numbered.

Over the past three years, the Society for the History of Technology has had the most rapid rate of increase in membership, rising by 115%. Over the past decade, the Philosophy of Science Association has had the largest percentage increase in membership, rising by 433%. In terms of actual numbers of new members, the Society for the History of Technology ranks first in the field with the addition of 844 over the past three years. Each of the societies publishes one periodical.

#### 19. General Science

There are eight scientific societies in the United States that are very broad in scope of coverage and multidisciplinary in outlook. They are related, directly or indirectly, to all of the other societies included in this study. They are the American Academy of Arts and Sciences, the American Association for the Advancement of Science, the American Council of Learned Societies, the American Philosophical Society, the National Academy of Sciences-National Research Council, the National Association for Research in Science Teaching, the National Science Teachers Association, and the Scientific Research Society of America.

#### D. MEMBERSHIP CHARACTERISTICS

The types of membership offered by the societies studied in this survey can be classified into the following categories:

- Individual
- Honorary
- Institutional
- Sustaining

Figure 19 gives a breakdown of the various types of membership commonly found in societies under each of the above categories. Counts of the number of societies in each discipline having the various membership types are shown in Table 2.

In terms of numbers of members, the engineering discipline is the largest with an aggregate of 708,970 society members, an average society membership of 14,468 and a median society membership of 4975. The median number of members for the materials group is 9829 and represents the largest median size for any of the discipline families.

Table 3 gives the total number of members, number of societies, the average number of members per society, and the median number of members for each discipline family.

#### E. DUES STRUCTURE

Table 4 presents data on the average dues of societies by discipline. The data on dues were obtained mostly from society brochures of the type mailed to prospective members during the July-October 1968 period. The overall average individual membership dues for all societies is \$14.30 per year. The engineering discipline family has the highest average dues of \$18.95 and also the highest median dues of \$18.00. The highest dues occur in the disciplines of engineering, biology, and psychological sciences, each of which have societies with annual dues greater than \$40.00. The anthropology discipline family has the lowest average dues of \$8.33 and also the lowest median of \$8.00.

TABLE 3  
SOCIETY MEMBERSHIP

DISCIPLINE FAMILY	TOTAL MEMBER-SHIP	NUMBER OF SOCIETIES	AVERAGE MEMBER-SHIP	MEDIAN MEMBER-SHIP
1. ENGINEERING	708,970	49	14,468	4,975

## F. SOURCES AND USES OF FUNDS

To determine the sources and levels of financial support and expenditures, society brochures and annual reports were examined. Some yearly issues of society journals and bulletins were also screened. On the whole, very little meaningful society financial information was available in the literature. (In many cases diverse income sources and expenditures were reported as a total and not itemized.)

All of the societies studied appeared to obtain some funding from dues. Only 47 indicated in their literature that they obtained a portion of their funding from corporate or industrial sponsors. All appear to use a portion of their income for publishing.

The percentage of societies (by discipline family) using one or more full-time paid employee to perform society administrative or editorial functions is shown in Table 5. It was found that many societies used a substantial amount of part-time and volunteer labor to perform administrative and other society functions. The amount, however, was not determinable.

## G. SCIENTIFIC INFORMATION AND COMMUNICATION FUNCTIONS

Since the time of their earliest appearance, scientific societies have played a prominent role in the recording and communication of scientific knowledge. In fact, the need for means to perform these functions has been the primary reason for creating scientific societies. Today, most of the societies assign positions of prominence to their information responsibilities in their published charters and statements of purpose.

TABLE 5

PERCENTAGE OF SOCIETIES USING  
FULL-TIME PAID EMPLOYEES BY DISCIPLINE

DESCRIPTIVE FAMILY	ONE OR MORE	FIVE OR MORE FULL-TIME PAID EMPLOYEES
1. ENGINEERING	59%	55%
2. CHEMISTRY	69	38
3. PHYSICS	42	32
4. GEOSCIENCES	48	33
5. AQUATIC SCIENCES	75	25
6. ATMOSPHERIC & SPACE SCIENCES	71	57
7. MATERIALS SCIENCES	77	69
8. MATHEMATICS & STATISTICS	47	35
9. AGRICULTURAL SCIENCES	50	28
10. BIOLOGICAL SCIENCES	29	10
11. PSYCHOLOGICAL SCIENCES	36	7
12. ECONOMICS	60	60
13. SOCIOLOGY AND SOCIAL WORK	20	20
14. ANTHROPOLOGY	40	20
15. LINGUISTICS	67	0
16. ARCHAEOLOGY	50	50
17. POLITICAL SCIENCE	50	50
18. PHILOSOPHY & HISTORY OF SCIENCE	0	0
19. GENERAL SCIENCE	75	63

Despite the commonality of these functions among scientific societies, the methods employed in performing them seem to vary greatly.

In the section that follows, the various scientific information functions and activities of scientific societies that were identified during the course of this study are presented and discussed.

### Publishing

Of interest were the number of societies publishing primary and secondary periodicals, scientific and technical special publications, news, data or standards, and educational materials. Information on primary and secondary type publications was available generally from most of the major sources consulted. Information on the contents of those publications was not readily available. Actual examination of specimen issues of the society publications would probably be necessary to obtain this kind of information from written sources. Table 6 presents the percentage of societies engaged in the publication of primary and/or secondary information by discipline family.

### Meetings

All of the societies represented in the study held national meetings. Many also maintained a regular series of regional meetings or conferences and symposia.

TABLE 6

15. LINGUISTICS	67
16. ARCHAEOLOGY	100
17. POLITICAL SCIENCE	100
18. PHILOSOPHY AND HISTORY OF SCIENCE	75
19. GENERAL SCIENCE	63

## Special Libraries and Information Centers

Although it is believed that many societies maintain libraries of varying sizes and services, only limited information on these libraries was available from the literature (see Table 7).

### H. MAINTENANCE OF PROFESSIONAL STANDARDS

One objective of the study was to identify the functions which scientific societies perform relative to the establishment and maintenance of professional standards in their discipline or area of interest. Among their means for doing this are the establishment of academic qualifications for membership in their society, licensing or certifying of qualified practitioners or professionals in the discipline, and the establishment of codes of ethics and professional standards. A great variety of membership qualification standards were observed for scientific societies. They ranged from a requirement for prospective members to have recognized preeminence in the field or discipline to the mere payment of dues. Figure 20 presents society membership requirements (academic) by discipline families.

### I. SOCIETY IDENTIFICATION AND REGISTRATION OF SPECIAL MANPOWER RESOURCES

The National Science Foundation maintains the National Register of Scientific and Technical Personnel by contract with selected scientific societies. The societies engaged with NSF in this effort are listed below:

American Anthropological Association  
American Chemical Society  
American Economic Association  
American Geological Institute  
American Institute of Biological Sciences  
American Institute of Physics  
American Mathematical Society  
American Meteorological Society  
American Political Science Association  
American Psychological Association  
American Sociological Association  
Engineers Joint Council  
Federation of American Societies for Experimental  
Biology

The number of societies regularly publishing directories listing their membership is reported in Table 8.

## J. INFLUENCE ON SCIENCE POLICY

Scientists as individuals influence science policy in a diversity of ways. Influential scientists are frequently leaders in scientific societies and the societies, through their meetings and publications, serve as a medium of communication through which policy is influenced. The same effect may be achieved in a more formalized and impersonal way through the establishment of committees within the societies. An even more formal means of influencing science policy is through society representation on national advisory groups, such as the National Academy of Sciences - National Research Council (NAS-NRC).

It was possible to ascertain through the literature that at least one out of six societies have special committees or other mechanisms for addressing science policy or research policy and slightly fewer have society policy committees. The number of societies having these types of committees by discipline family is shown in Table 9.

TABLE 9  
POLICY COMMITTEES BY DISCIPLINE FAMILY

16. ARCHAEOLOGY	0	0
17. POLITICAL SCIENCE	0	0
18. PHILOSOPHY AND HISTORY OF SCIENCE	1	0
19. GENERAL SCIENCE	1	1

Society representation on national advisory groups such as the NAS-NRC is an even more formal mechanism for influencing science policy. As early as 1863, the National Academy of Sciences was created to serve an official role in advising the Federal government on science policy. With the creation of the National Research Council as the research arm of NAS in 1916, selected societies have a direct role through the nomination of the members of the NRC.

Other national advisory groups with society affiliations are the American Council of Learned Societies, the Social Science Research Council, and the American Council on Education.

Approximately one third of the societies in this study are represented on NAS-NRC and a small number are affiliated with the other groups. The number of cooperating societies in each group by discipline family is shown in Table 10. The percentage of societies represented on NRC by discipline family is shown in Table 11.

## K. CHANGES SINCE 1958

In 1957, Sputnik launched a new era in scientific endeavors. Activity in scientific education was improved and increased on all levels. Federal Government research and development activities were increased. NASA was organized and nurtured the public interest in science. What effect has all of this had on scientific societies? While no casual relationships can be established, some interesting correlations do exist.

The population of the country has increased by about 15 percent, while the overall average increase in membership in scientific societies has increased by 88 percent since 1958, thus reflecting to a degree the increased nationwide interest in science. Figure 21 gives the percentage membership changes for the past three and the past ten years.\*

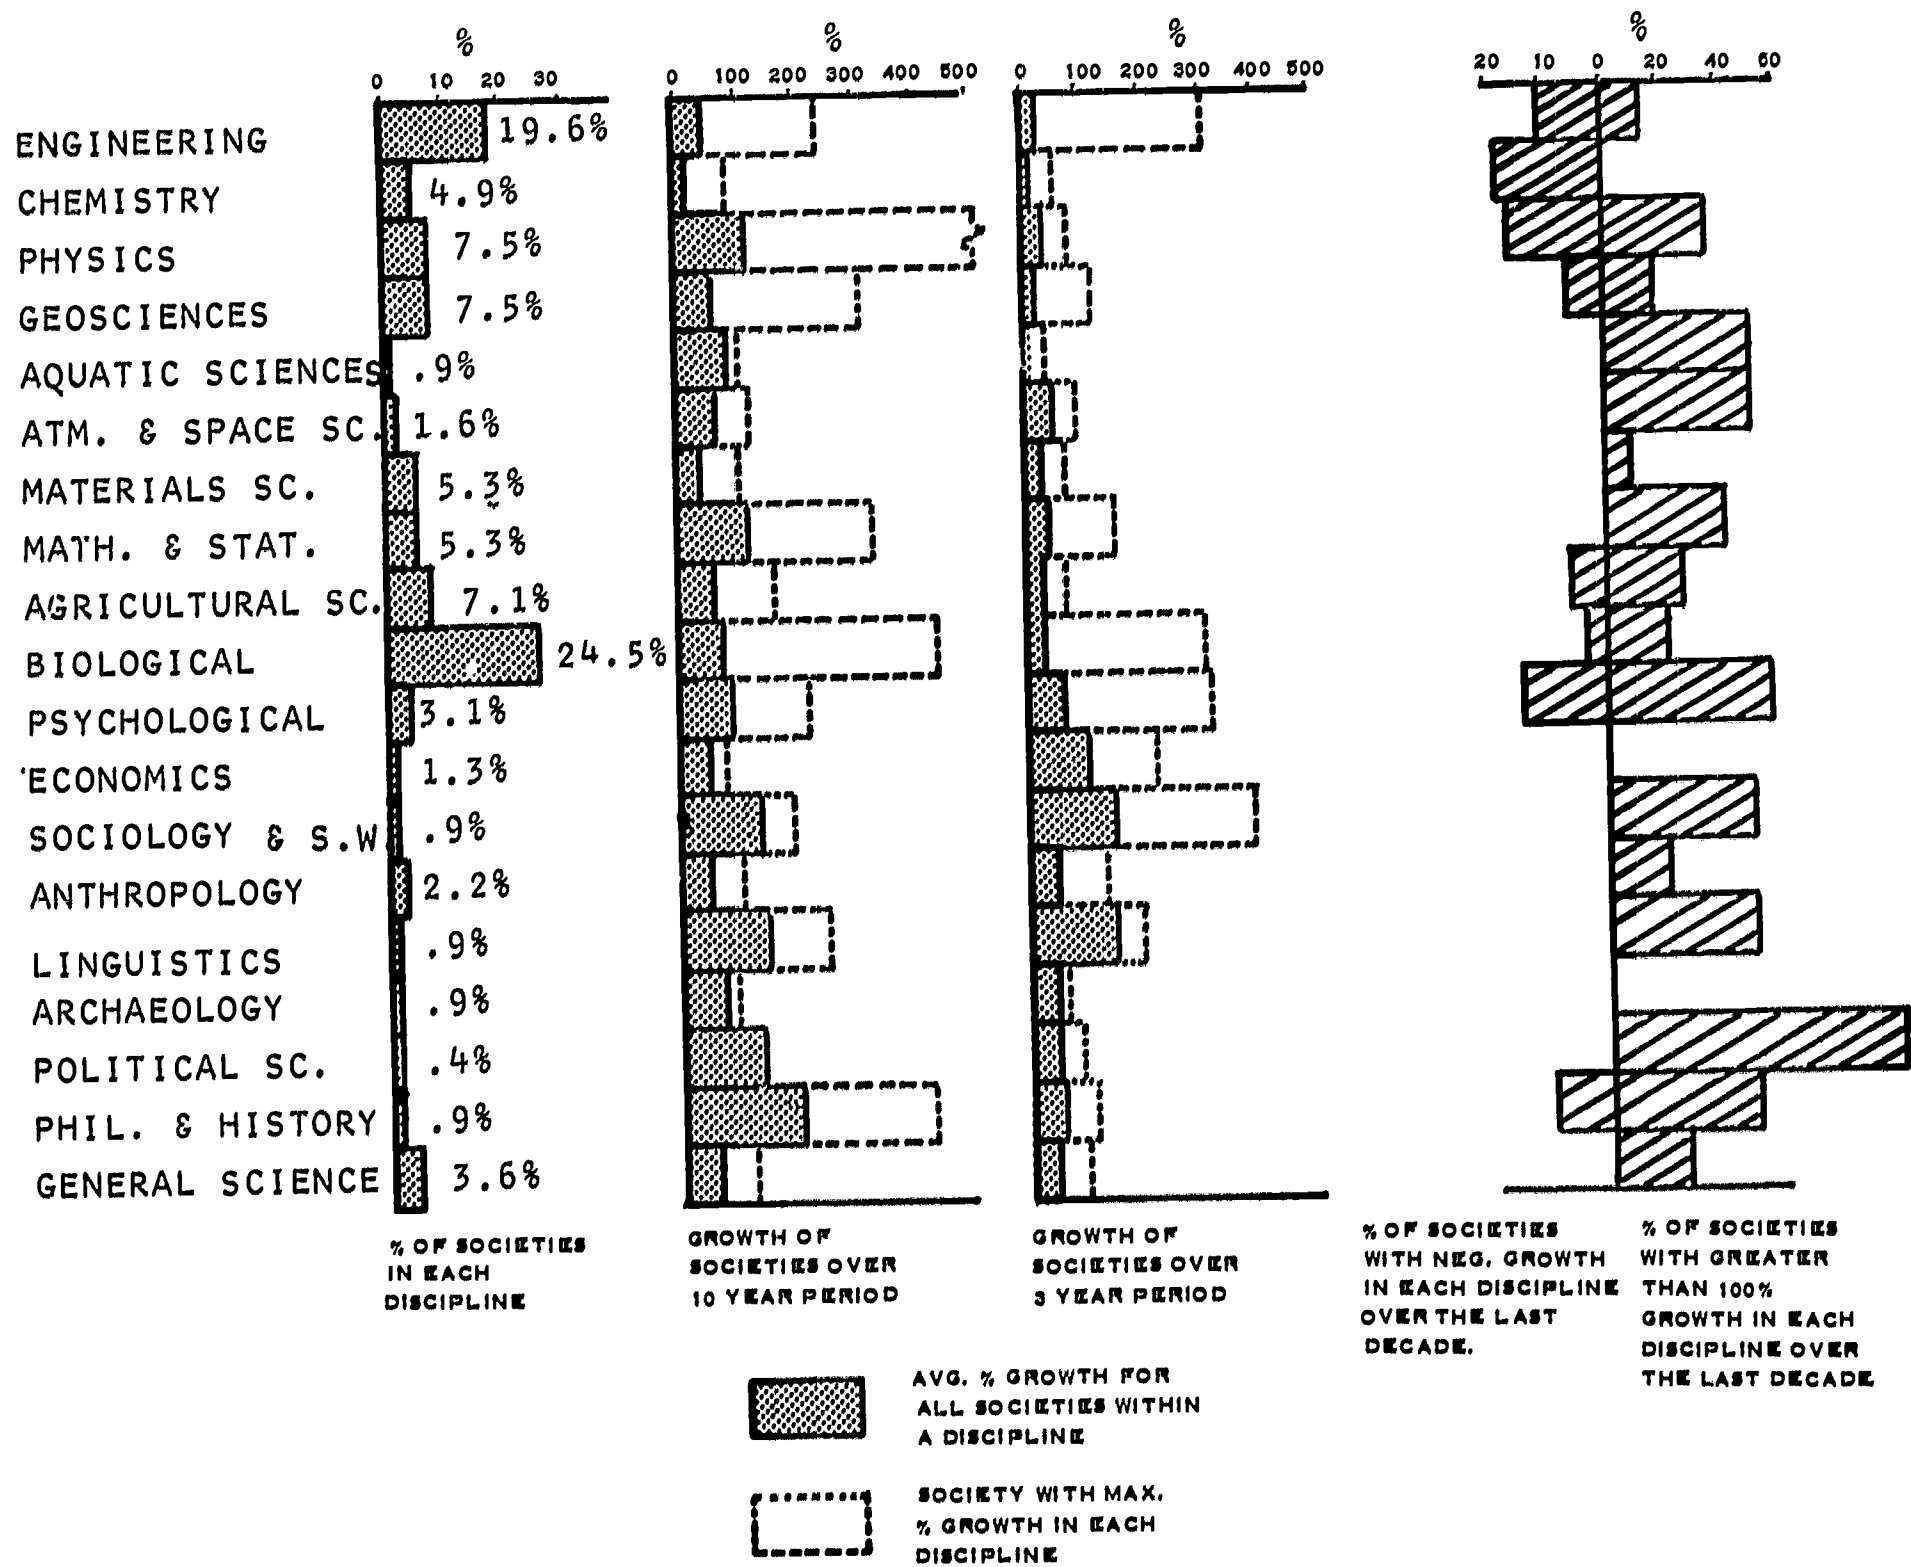

It would have been interesting to compare the percentage change in dues over the last decade but sufficient data was not available from the literature for meaningful analysis.

The classically oriented disciplines (e.g., Chemistry, Physics, Mathematics, and Biology) have a significant number of supporting societies but there is an emerging group of discipline families, conglomerate in terms of the classically oriented disciplines, which have societies covering

---

\*These are approximate figures since some members belong to more than one society, but the percentage of members who do has probably remained somewhat constant, thus, at least partially cancelling out the duplicate member effect.

FIGURE 21  
MEMBERSHIP CHANGE (3 YEARS, 10 YEARS)

various areas. These new disciplines, the aquatic sciences, space sciences, and management sciences, have grown in importance during the last decade. While there is no way to forecast confidently future trends, it appears that much emphasis will be given to the social sciences and the human behavioral sciences.

## SECTION II

### COMMENTS ON DATA COLLECTION METHODOLOGY

The data collected in the course of this study were obtained primarily from the various directories of scientific societies and brochures, prospectuses, and other materials routinely available from the societies. One of the objectives of the study was to determine the feasibility of using this type of data collection methodology. In the event that the purposes of the study could not be met by obtaining data from the literature, the approach used provided for the possibility of a second phase which would include collection of data directly from the societies by means of a mail questionnaire. Therefore, one requirement of this study was to identify gaps in the data base in order to determine if a Phase II (the questionnaire survey) were necessary to acquire essential data.

In its original proposal, WOLF suggested (since the study just completed is the third such study carried out by the National Science Foundation in the last nine years), that consideration be given to processing the data resulting from this study into a readily manipulable and maintainable data file.

The gaps in the data, a plan for the development of a readily manipulable and maintainable data file, and recommendations for Phase II (survey) will be discussed in the following paragraphs.

## A. INADEQUACIES OF THE LITERATURE

Working from the data specifications approved by NSF, WOLF pursued the identification, acquisition, extraction, and recording of all pertinent data available in documented form. The main efforts were concentrated on the utilization of available reference works (principally the current and previous editions of the NAS-NRC and the Gale directories) and various brochures, and other information received from the individual societies themselves. Where applicable, the data from the two previous NSF supported surveys of scientific societies were also used. (See Appendix I - Sources of Information).

The following types of information on professional scientific societies were found to be not readily obtainable through the use of literature search techniques:

1. Sources of Funds (amounts and percentages)
2. Uses of Funds (amounts and percentages)
3. Quantitative Data on Use of Part Time or Voluntary Labor to Perform Staff Functions
4. Chief Occupation of Paid Personnel (editorial, administrative, clerical, or other)
5. Science Information Activities Other Than Publishing
6. Use of Referees in Publication Selection

7. Percentage of Submitted Articles Rejected
8. Publication Backlogs
9. Publication Dates of Special Publications
10. Levels of Attendance at Recent Society Meetings
11. Occupational Affiliation of Membership (government, business, industry, academic, or others)
12. Degree of Society Involvement in the Maintenance of Professional Standards
13. Levels of Activity in the Identification and Registration of Special Scientific Manpower Resources to Meet National Needs
14. Permanency of Society Headquarters' Address (may or may not change with the election of new officers)
15. Addresses of Major Society Officers and Committee Chairman (while currently in office)
16. Terms (years) of Major Society Officers
17. Future Plans

The types of information not available through the literature represent a significant part of the total information determined to be of interest to NSF.

The literature search methodology employed for data gathering in this study yielded mostly secondary data, that is to say data that are obtained from other than first-hand sources responding to a specific inquiry in a specific context. The use of secondary data as the basis for a study such as the one conducted and reported herein, gives rise to the following basic problems:

1. All data are subject to a variety of factual and interpretational errors, and cannot be readily verified.
2. The data available must be extracted out of one context and selected to provide specific answers in another context.
3. The data which are available are collected and published at varying intervals, thus precluding the possibility of establishing a consistent time base for the study results.
4. Items requiring judgment for determination, such as subject categorization, do not carry the authority or accuracy of a primary source.
5. Negative data are rarely available.

For the reasons cited above, it is believed that the secondary nature of the data collected for this study is a more limiting factor with respect to the study results than the sparseness of the available data.

## B. FUGITIVE SOCIETIES

The work plan followed in this study was designed to identify, evaluate, and select the maximum number of societies which met the established criteria (See Appendix II) in the time available. This was done, resulting in the validation of 96 more societies than were included in the 1964 NSF survey report. It is estimated that an additional 30 societies which would also meet the established criteria could have been identified through extensive searching in less productive sources. Admittedly, most of these possible additions to the universe would be smaller in size, more recently founded, and somewhat less significant when compared to their discipline family leaders. Nevertheless, their inclusion would provide useful information and would have made the coverage of the study more complete.

## C. EXCLUSION OF MEDICAL SOCIETIES

In accordance with the directions of NSF, societies which had as their main area of interest "clinical medicine" were excluded from this study. Many of these societies are closely related with some of the organizations included in the Biological Sciences (Figure 10) and have intertwined research and information activities. Their exclusion introduced a significant limitation on the ability of the authors to present the most meaningful portrayal of the existing society activities or information exchange patterns in the biomedical area.

#### D. COMPUTER BASED FILE

Any consideration for further work in collecting data on scientific societies should include careful consideration of using computers. For example, a computer based system would allow NSF to conduct a study of societies as follows:

- Store all data on each of the societies on magnetic tape or discs.
- Print out a data form for periodic update including all of the data for an individual society and in such a format as to be self explanatory.
- Mail the data form to the society along with a transmittal letter, instructions, and a list of any special questions for which data is not yet included in the file.
- The respondent enters only that data on the form where changes are necessary and returns the updated form to the National Science Foundation.
- Edit and keypunch the changes entered on the form.
- Update the computer files with the changed information and retain certain historical data in the file.
- Automatically generate address labels for the followup letters to nonrespondents by means of the computer.

- Automatically prepare pre-determined cross tabulations of data from the new data in the computer files.
- Automatically plot historical trends from the new data and the historical data retained in the file.
- Prepare many alternative groupings of societies, into discipline families for example. This could be done quickly and inexpensively by the computer by merely changing the grouping criteria.
- Prepare special data compilations quickly and inexpensively on a one-time basis.
- Prepare a brief summary (by the NSF staff) based on the analysis of the trends, tables, and groupings generated by the computer.
- Maintain names and addresses of current society officials by storing the expiration date of the officer's term and periodically printing out a questionnaire and mailing label to the outgoing officer to solicit the name of his successor.

The results produced by such a computer based system could be distributed as appropriate to the various potential users. The written summaries, tables, trend plots, and groupings would possibly be used by high level administrators in the Foundation. Complete printouts of data for each society could possibly be distributed to staff members dealing directly with the societies.

Some of the advantages of a computer based system such as the one given as an example above are:

- Eliminate study design effort each time data is collected.
- Encourage societies to respond by making it possible for them to merely correct those items of data which are no longer current.
- Encourage societies to respond by indicating that incorrect data will be used if they do not bring it up-to-date.
- Provide inexpensive data reduction for the production of aggregate statistics, tables, and trend data.
- Produce a complete, current report of all data on an individual society or on all societies at any time.
- Standardize the criteria for periodic data collection to provide more accurate trend analysis.

#### E. PHASE II (SURVEY)

Now that the extraction of data from the literature is complete, it appears that there are four options available with respect to the possibility of additional data collection,

Option 1 would call for the design of a questionnaire for mailing to each of the societies to collect selected data, not in the literature, which is of current importance to the foundation.

Option 2 would be a questionnaire study similar to Option 1 except that all data including some already obtained from the secondary sources, would be obtained directly from the most reliable source, the societies themselves. A new questionnaire would have to be developed since the Data Worksheet developed for extracting this data from the literature would not be adequate for use as a mail questionnaire.

Option 3 would be to develop a computer based system which could incorporate the data extracted from the literature and use this as the basis for a first file update operation in which data would be collected directly from the societies. Such a system could operate essentially as described in the preceding section of this report.

Option 4 is to utilize the data extracted from the literature and to do no further data collection in the near future.

#### F. RECOMMENDATIONS FOR FURTHER DATA COLLECTION

Three times in the past nine years, the National Science Foundation has collected data on professional scientific societies. It is reasonable to assume that complete and current data on scientific societies will be of even greater importance in the future. A computer

based system would provide NSF with the means to inexpensively collect and process complete, current data on scientific societies on a periodic basis over a number of years. It would also provide the means to collect the data in the near future to fill those gaps created by extracting the data from the literature.

It is therefore recommended that the National Science Foundation develop a computer based system for collecting and processing data on scientific societies, that the data extracted from the literature be incorporated as the initial data base in the system, and that immediately upon completion of the development of the system, a complete survey of all scientific societies be accomplished by means of the system.

### SECTION III CONCLUSIONS

From the findings and experience derived from this study, the following general conclusions have been drawn:

- In most of the major scientific disciplines or fields, one society occupies a dominant position with respect to the development, coordination, and direction of science information activities in that field. In the less well established or emerging fields it is possible to predict and estimate the probable or most likely society to assume such a role by analyzing the societies comprising the discipline family.
- A comprehensive study of scientific societies in the United States should include societies primarily identified with clinical medicine, since they represent a significant portion of the biological research field.
- Future studies of the U. S. scientific societies would be greatly facilitated by the continued maintenance of a data base of information previously collected and from which new data gathering could be readily performed.

Though the nature of the data available in the literature pertinent to the activities and functions of U. S. societies has served to limit severely the analysis and articulation of many topics of interest and to limit

the creditability of many of the findings, these limitations in the results should not obfuscate the significant findings and results of the study. First, the study conclusively proved that the literature and other existing documentation do not provide an adequate basis for analyzing and studying scientific societies; a fact which was unknown prior to the study and one which NSF was interested in determining. Additionally, the study effort has accomplished the following:

- It has served to identify the universe of the U. S. scientific societies more completely than it has ever been defined before. While it is certain that not every society satisfying the criteria set forth by NSF has been identified, it is likely that the number of unidentified societies is small, probably less than 15% of the total.
- The study has produced the most comprehensive and detailed description of the significant topics concerning the characteristics of U. S. societies as a whole, and the specific characteristics of individual societies which would be of interest to the National Science Foundation.
- The study developed means and techniques for categorizing and arraying societies relative to scientific disciplines which provide new insight into the informal organization and science information systems operating within the scientific community.

- The study has developed concepts, plans, and recommendations concerning the further collection and maintenance of scientific society data through which far greater utility and efficiency can be realized.

These achievements are of lasting significance, while the primary limitations of the study, e.g., the lack of data and the secondary nature of the data, can be remedied by a relatively short-termed, low level of effort.

APPENDIX II  
CRITERIA FOR VALIDATION

## CRITERIA FOR VALIDATION

### A. Eligible Sciences:

Physics

Chemistry

Biology (to include medical\* and agricultural sciences)

Earth sciences (geochemistry, geology, geophysics, meteorology)

Oceanography

Astronomy

Engineering (research)

Mathematics

Social sciences (archaeology, anthropology, psychology, linguistics, geography, history of science and technology, economic sciences, political science, and sociology)

Multidiscipline

- B. Society should be national in scope and membership, not regional, state-wide or with limited membership.
- C. Society members should be composed primarily of scientists and/or engineers engaged in scientific or engineering work at a professional level.
- D. No Greek letter or honorary societies or state academies should be included.

---

\* Clinical Medicine excluded.

OTHER SOCIETIES Description of Relationship

NON-SOCIETIES Description of Relationship

(19) INFORMATION FUNCTIONS S A

Operates Speakers Bureau	YES	NO
Conducts Research in Information	YES	NO
Maintains or Sponsors a Special Library or Information Center	YES	NO

DESCRIPTION:

OTHER INFORMATION ACTIVITIES

(20) RESEARCH ACTIVITIES S A

Society	YES	NO
Society Sponsored	YES	NO

DESCRIPTION:

(17) IDENTIFICATION AND REGISTRATION OF SPECIAL SCIENTIFIC MANPOWER RESOURCES S A

Collect and Maintain Statistical Data on Manpower Resources	YES	NO
Regularly Publish Membership Directories	YES	NO
Special Interest or Copability Registers	YES	NO
Maintains NSF Manpower Survey Register	YES	NO
Other Manpower Resources Activities	YES	NO

If Yes to Above, Comment on Availability of Such Information

(18) SOCIETY STAFF S A

Total

Paid Full-Time Personnel	YES	NO
Paid Part-Time Personnel Only	YES	NO
Voluntary Labor Only	YES	NO

NUMBER

CHIEF ACTIVITIES OF PAID PERSONNEL

(27) SUBJECT CATEGORIES

10. Engineering:

11. Aeronautical

12. Chemical

13. Civil

.01 Architectural

.02 Structural

.03 Sanitary

14. Electrical

15. Mechanical

16. Industrial

17. Other engineering fields

.01 Agricultural

.02 Ceramic

.03 Geological

.04 Mining

.05 Nuclear

.06 Petroleum

.07 Textile

.20 Other engineering

20. Physical Sciences:

21. Chemistry

.01 Agricultural and food chemistry

.02 Analytical chemistry

.03 Inorganic chemistry

.04 Organic chemistry

.05 Physical chemistry

.06 Physical organic chemistry

.07 Radiochemistry and isotope chemistry

.08 Theoretical chemistry

.20 Other chemistry

22. Earth Sciences

.01 Climatology

.02 Geochemistry

.03 Geodesy and cartography

.04 Geography (physical)

.05 Geology

.06 Geophysics

.07 Hydrology and hydrography

.08 Meteorology

.09 Mineralogy

.10 Oceanography

.11 Paleontology

.12 Petrography and Petrology

.13 Seismology and volcanology

.14 Stratigraphy, geomorphology and tectonics

.15 Terrestrial magnetism and electricity

.20 Other earth sciences

23. Physics

.01 Acoustics

.02 Atomic and molecular physics

.03 Electromagnetic phenomena

.04 Electron physics and gaseous discharge

.05 Mechanics

.20 Nuclear physics and astrophysics

40. Life Sciences:

41. Agricultural Sciences

.01 Agronomy

.02 Animal husbandry

.03 Crops

.04 Dairy husbandry

.05 Fish and wildlife

.06 Food technology

.07 Forestry

.08 Horticulture

.09 Range management

.10 Soils

.20 Other agricultural sciences

42. Biological Sciences

.01 Anatomy

.02 Anthropology (physical)

.03 Bacteriology

.04 Biochemistry

.05 Biology

.06 Biometrics

.07 Biophysics

.08 Biostatistics

.09 Botany

.10 Entomology

.11 Genetics

.12 Microbiology

.13 Nutrition

.14 Pathology

.15 Pharmacology

.16 Phytopathology

.17 Physiology

.18 Zoology

.20 Other biological sciences

43. Medical Sciences

.01 Anesthesiology

.02 Cardiology

.03 Dermatology

.04 Dentistry

.05 Geriatrics

.06 Internal medicine

.07 Neurology

.08 Obstetrics and Gynecology

.09 Ophthalmology

.10 Otolaryngology

.11 Pediatrics

.12 Pharmacy

.13 Physical medicine and rehabilitation

.14 Podiatry

.15 Psychiatry

.16 Public Health

.17 Radiology

.18 Surgery

.19 Veterinary medicine

.20 Other clinical sciences

50. Psychological Sciences:
